Splunk SPLK-1002 Questions [2026]

Studying with updated SPLK-1002 practice questions improve your skills of clearing the certification test in a short time. ITPassLeader makes it easy for you to prepare successfully for the SPLK-1002 Questions in a short time with SPLK-1002 Dumps. The product of ITPassLeader has been prepared under the expert supervision of thousands of experts worldwide.

Splunk Core Certified Power User Exam Sample Questions (Q64-Q69):

NEW QUESTION # 64

Which statement is true?

- A. In most cases, each Splunk user will create their own data model.
- B. Pivot is used for creating datasets.
- **C. Pivot is used for creating reports and dashboards.**
- D. Data model are randomly structured datasets.

Answer: C

Explanation:

Reference:

Pivot is used for creating reports and dashboards. Pivot is a tool that allows you to create reports and dashboards from your data models without writing any SPL commands. Pivot can help you visualize and analyze your data using various options, such as filters, rows, columns, cells, charts, tables, maps, etc. Pivot can also help you accelerate your reports and dashboards by using summary data from your accelerated data models.

Pivot is not used for creating datasets or data models. Datasets are collections of events that represent your data in a structured and hierarchical way. Data models are predefined datasets for various domains, such as network traffic, web activity, authentication, etc. Datasets and data models can be created by using commands such as datamodel or pivot.

NEW QUESTION # 65

When you mouse over and click to add a search term this (thesE. Boolean operator(s) is(arE. not implied. (Select all that apply).

- A. OR
- B. NOT
- C. AND
- D. ()

Answer: D

NEW QUESTION # 66

A user runs the following search:

index=X sourcetype=Y | chart count (domain) as count, sum (price) as sum by product, action useNull=f useOther=f Which of the following table headers match the order this command creates?

- A. Product, count: addtocart, count: remove, count: purchase, sum: addtocart, sum: remove, sum: purchase
- B. Product, sum: addtocart, sum: remove, sum: purchase, count: addtocart, count: remove, count: purchase
- C. Count: product, sum: product, count: action, sum: action
- D. The chart command does not allow for multiple statistical functions.

Answer: A

Explanation:

The correct answer is C. Product, count: addtocart, count: remove, count: purchase, sum: addtocart, sum: remove, sum: purchase. In Splunk, the chart command is used to create a table or a chart visualization from your data. The chart command takes at least one function and one field, and optionally another field to group by.

In the given search, the chart command is used with two functions (count and sum), two fields (domain and price), and two fields to group by (product and action). The useNull=f and useOther=f options are used to exclude null values and other values from the chart.

The chart command creates a table with headers that match the order of the fields and functions in the command. The headers for the count function are prefixed with count:, and the headers for the sum function are prefixed with sum:. The values of the product and action fields are used as the suffixes for the headers.

Therefore, the table headers created by this command are Product, count: addtocart, count: remove, count: purchase, sum: addtocart, sum: remove, and sum: purchase.

NEW QUESTION # 67

What does the transaction command do?

- A. Separates two events based on one or more values.
- B. Groups a set of transactions based on time.
- C. Creates a single event from a group of events.
- D. Returns the number of credit card transactions found in the event logs.

Answer: C

Explanation:

The transaction command is a search command that creates a single event from a group of events that share some common characteristics. The transaction command can group events based on fields, time, or both. The transaction command can also create some additional fields for each transaction, such as duration, eventcount, starttime, etc. The transaction command does not group a set of transactions based on time, but rather groups a set of events into a transaction based on time. The transaction command does not separate two events based on one or more values, but rather joins multiple events based on one or more values. The transaction command does not return the number of credit card transactions found in the event logs, but rather creates transactions from the events that match the search criteria.

NEW QUESTION # 68

Which statement is true?

- A. In most cases, each Splunk user will create their own data model.
- B. Pivot is used for creating datasets.
- C. Pivot is used for creating reports and dashboards.
- D. Data models are randomly structured datasets.

Answer: C

Explanation:

Explanation

The statement that pivot is used for creating reports and dashboards is true. Pivot is a graphical interface that allows you to create tables, charts, and visualizations from data models. Data models are structured datasets that define how data is organized and categorized. Pivot does not create datasets, but uses existing ones.

NEW QUESTION # 69

.....

Our Splunk Core Certified Power User Exam (SPLK-1002) practice exam highlights mistakes at the end of each attempt, allowing you to overcome them before it's too late. This kind of approach is great for complete and flawless Splunk Core Certified Power User Exam (SPLK-1002) test preparation. A free demo version is also available for satisfaction.
