Salesforce Certified MuleSoft Associate Salesforce-MuleSoft-Associate Prüfungsfragen mit Lösungen (Q38-Q43):

38. Frage

An integration team follows MuleSoft's recommended approach to full lifecycle API development. Which activity should this team perform during the API implementation phase?

- A. Use the API specification to build the MuleSoft application
- B. Design the API specification
- C. Use the API specification to monitor the MuleSoft application
- D. Validate the API specification

Antwort: A

Begründung:

MuleSoft recommends a full lifecycle API development approach which includes several phases such as design, implementation, testing, deployment, and management. During the API implementation phase, the primary activity is to use the API specification to build the MuleSoft application. Here's a detailed explanation:

API Design:

Create API Specification: Initially, an API specification is created using RAML or OAS (OpenAPI Specification) to define the API's structure, endpoints, request/response formats, and security requirements.

API Implementation:

Build Mule Application: Using the API specification as a blueprint, the development team implements the MuleSoft application. This involves creating flows, integrating with backend systems, and ensuring the API functions as specified.

APIKit: MuleSoft provides APIKit, a tool that automatically generates Mule flows based on the API specification, speeding up the development process.

Testing: During implementation, unit tests (using MUnit) and integration tests are created to ensure the API behaves as expected.

Validation and Monitoring:

Validate Against Specification: Throughout the implementation phase, the API is continuously validated against the original specification to ensure compliance.

Deployment and Monitoring: Post-implementation, the API is deployed, and tools like Anypoint Monitoring are used to monitor its performance and usage.

39. Frage

A high-volume eCommerce retailer receives thousands of orders per hour and requires notification of its order management warehouse, and billing systems for subsequent processing within 15 minutes of order submission through its website. Which integration technology, when used for its typical and intended purpose, meets the retailer's requirements for this use case?

- A. Extract Transform Load (ETL)
- B. Managed File Transfer (MFT)
- C. Publish/Subscribe Messaging Bus (Pub/Sub)
- D. Enterprise Data Warehouse (EDW)

Antwort: C

Begründung:

For a high-volume eCommerce retailer requiring real-time or near-real-time notifications to multiple systems, a Publish/Subscribe Messaging Bus is an ideal choice. Here's a detailed explanation:

Publish/Subscribe Model:

Definition: The Pub/Sub messaging model allows messages to be sent (published) by producers and received (subscribed to) by multiple consumers.

Asynchronous Communication: It decouples the sender and receiver, enabling asynchronous communication.

Use Case Fit:

Real-Time Processing: Suitable for scenarios requiring real-time or near-real-time data processing and notification.

Scalability: Handles high volumes of messages efficiently, making it suitable for environments with thousands of transactions per hour.

Implementation:

Message Broker: A message broker (e.g., Apache Kafka, RabbitMQ) can manage the distribution of messages to the order management, warehouse, and billing systems.

Guaranteed Delivery: Ensures that messages are reliably delivered to all subscribed systems within the required time frame.

Pub/Sub Messaging: Understanding Publish/Subscribe Messaging

40. Frage

According to MuleSoft which deployment characteristic applies to a microservices application architecture?

- A. A deployment to enhance one capability requires a redeployment of all capabilities
- B. Services exist as independent deployment artifacts and can be scaled independently of other services
- C. All services of an application can be deployed together as single Java WAR file
- D. Core business capabilities are encapsulated in a single deployable application

Antwort: B

Begründung:

Microservices architecture is designed to enhance flexibility, scalability, and maintainability by decomposing applications into small, independent services. Here's a detailed explanation:

Independent Deployment:

Definition: Each microservice is developed, deployed, and managed independently. This allows teams to work on different services without interfering with each other.

Scalability: Services can be scaled independently based on demand, improving resource utilization and system resilience.

Benefits:

Flexibility: Enhances the ability to update or scale specific parts of an application without affecting the whole system.

Resilience: Isolates failures to individual services, preventing cascading failures across the entire application.

Technology Diversity: Allows the use of different technologies and languages best suited for each service.

What are two reasons why a typical MuleSoft customer favors a MuleSoft-hosted Anypoint Platform runtime plane over a customer-hosted runtime for its Mule application deployments? (Choose two.)

- A. increased application isolation
- **B. Reduced IT operations effort**
- C. Reduced application latency
- **D. Reduced time-to-market for the first application**
- E. Increased application throughput

Antwort: B,D

Begründung:

Choosing a MuleSoft-hosted Anypoint Platform runtime plane offers several advantages, particularly in terms of deployment efficiency and operational management. Here's a detailed explanation of the selected reasons:

Reduced Time-to-Market for the First Application:

Pre-Configured Environment: MuleSoft-hosted Anypoint Platform provides a ready-to-use environment, which accelerates the deployment process.

Ease of Use: Developers can quickly set up and deploy applications without the need for extensive infrastructure setup and configuration.

Reduced IT Operations Effort:

Managed Services: MuleSoft handles the infrastructure management, including updates, scaling, and maintenance, reducing the operational burden on the IT team.

Focus on Development: IT teams can focus on developing and optimizing applications rather than managing runtime environments.

According to MuleSoft which system integration term describes the method, format and protocol used for communication between two systems?

- A. Interaction
- **B. Interface**
- C. Component
- D. Message

Antwort: B

Begründung:

In system integration, the term "interface" describes the method, format, and protocol used for communication between two systems.

Here's a detailed explanation:

Interface:

Definition: An interface defines the point of interaction between two systems, specifying how data is exchanged, including the communication method, data format, and protocol.

Components: Typically includes API endpoints, data formats (e.g., JSON, XML), communication protocols (e.g., HTTP, HTTPS), and authentication mechanisms.

Importance:

Standardization: Ensures that different systems can communicate effectively by adhering to predefined standards and protocols.

Interoperability: Facilitates seamless interaction and data exchange between disparate systems, enhancing overall integration.

Examples:

RESTful APIs: Define interfaces using HTTP/HTTPS and data formats like JSON or XML.

SOAP Web Services: Use XML-based messages and protocols such as HTTP or HTTPS for communication.
