We often regard learning for JN0-105 exam as a torture. Actually, learning also can become a pleasant process. With the development of technology, learning methods also take place great changes. With our JN0-105 study materials, all of your study can be completed on your computers because we have developed a kind of software which includes all the knowledge of the exam. The simulated and interactive learning environment of our JN0-105 Practice Engine will greatly arouse your learning interests.

We are willing to provide all people with the demo of our JN0-105 study tool for free. If you have any doubt about our products that will bring a lot of benefits for you. The trial demo of our JN0-105 question torrent must be a good choice for you. By the trial demo provided by our company, you will have the opportunity to closely contact with our JN0-105 Exam Torrent, and it will be possible for you to have a view of our products. More importantly, we provide all people with the trial demo for free before you buy our JN0-105 exam torrent and it means that you have the chance to download from our web page for free; you do not need to spend any money.

JN0-105 Authorized Certification - First-grade Juniper JN0-105 Best Preparation Materials

It results in JN0-105 exam failure and loss of time and money. To pass the Juniper JN0-105 exam in a short time, you must prepare with updated Juniper JN0-105 practice questions. However, the Free4Dump is one of the best and most dependable. This platform offers updated and Real JN0-105 Exam Questions that help applicants ace the JN0-105 test for the first time.

Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q77-Q82):

NEW QUESTION # 77

You configured your system authentication order using the set authentication-order tacplus radius password command. Which statement is correct in this scenario?

- A. The password authentication method is evaluated if the TACACS+ and RADIUS servers respond with a reject message.
- B. A rejection by TACACS+ will prevent a login and bypass the other two authentication methods.
- C. All authentication methods are used with the most restrictive permission set used.
- D. The password authentication will only be used if the TACACS+ and RADIUS servers fail to respond.

Answer: D

Explanation:

In the scenario where the system authentication order is set to "tacplus radius password," the correct statement is (B). If the TACACS+ and RADIUS servers are unreachable or fail to respond, the system will fall back to using password authentication. This

ensures that users can still authenticate using locally stored passwords if external authentication servers are unavailable.

NEW QUESTION # 78

Which two statements are true about the Junos OS? (Choose two.)

- A. Exception traffic is never sent to the control plane.
- B. Routing tables are stored in the forwarding plane.
- C. Routing tables are stored in the control plane.
- D. Exception traffic is sent to the control plane.

Answer: C,D

Explanation:

In Junos OS, as with many network operating systems, the control plane is responsible for processes that determine how to route traffic. This includes maintaining routing tables, which store information about network paths and protocols. Therefore, routing tables are indeed stored in the control plane.

Exception traffic refers to packets that cannot be processed by the normal fast-path processing of the Packet Forwarding Engine (PFE) in the forwarding plane, and thus are sent to the control plane for further processing. This might include packets destined for the router itself, packets that need to be fragmented, or packets that match certain firewall filter criteria, among other reasons. Routing tables are not stored in the forwarding plane. However, the forwarding plane contains the forwarding table (sometimes referred to as the forwarding information base or FIB), which is a distilled version of the routing table optimized for fast packet forwarding. The forwarding plane uses this information to perform the actual transfer of packets across the network device interfaces.

NEW QUESTION # 79

Which two statements are correct regarding Layer 2 network switches? (Choose two.)

- A. Switches create a single collision domain.
- B. Switches are susceptible to traffic loops.
- C. Switches do not learn MAC addresses.
- D. Switches flood broadcast traffic.

Answer: B,D

Explanation:

Layer 2 network switches are crucial components in local area networks (LANs), providing multiple functions for data packet forwarding and network segmentation. One inherent characteristic of switches is their susceptibility to traffic loops, especially in networks with redundant paths. Without proper loop prevention protocols like Spanning Tree Protocol (STP), loops can cause broadcast storms and network instability. Additionally, switches inherently flood broadcast traffic to all ports within the broadcast domain, except the port on which the broadcast was received. This is because broadcast frames are meant to be delivered to all devices within the VLAN, and the switch ensures this by flooding these frames to all ports in the VLAN, except the source port.

NEW QUESTION # 80

Which prompt indicates that you are using configuration mode?

- A. #
- B. %
- C. >
- D. \$

Answer: A

Explanation:

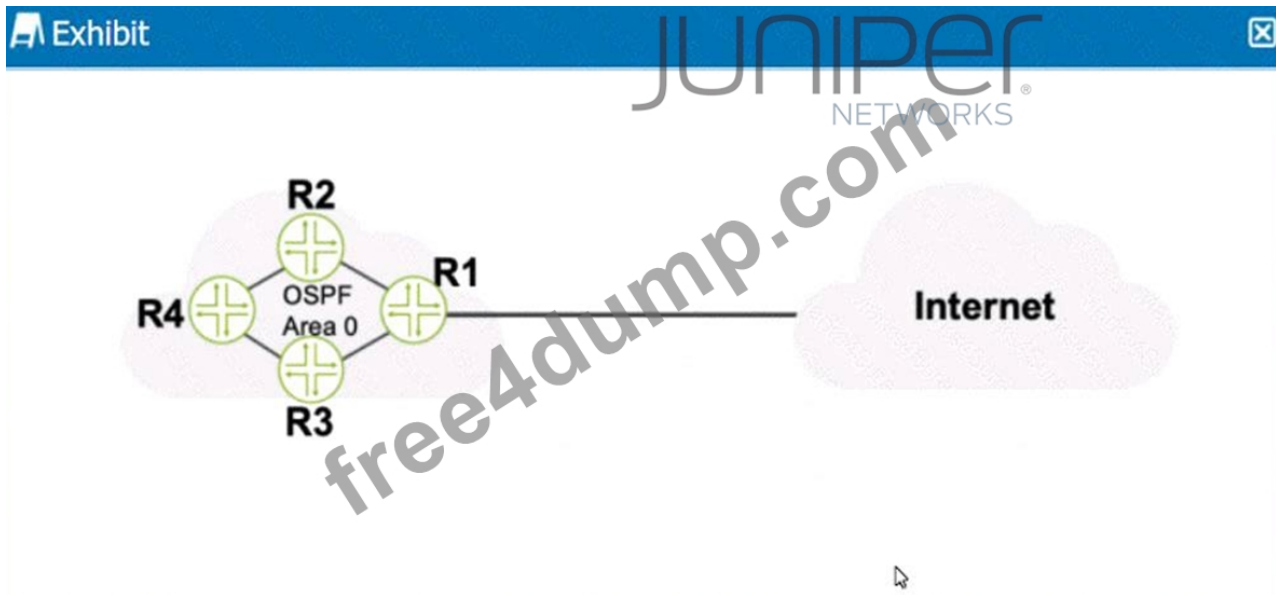

In Junos OS, the # prompt indicates that you are in configuration mode. This mode is used for making changes to the configuration of the device.

Reference: Juniper Networks CLI Modes

"The # prompt indicates that you are in configuration mode."

NEW QUESTION # 81

Click the Exhibit button.

Referring to the exhibit, what should be configured on R1 to advertise a default static route into OSPF?

- A. a loopback interface
- B. a management interface
- C. a firewall filter
- D. a routing policy

Answer: D

Explanation:

To advertise a default static route into OSPF on router R1, a routing policy should be configured. This policy would typically include a statement to match the default route (0.0.0.0/0) and then apply an action to set the route as an OSPF external type, which would then be redistributed into the OSPF domain. The routing policy is a set of conditions and actions that determine how routes are imported into or exported from the routing table and how routes are shared between routing instances or routing protocols. After defining the policy, it must be applied to OSPF under the export section of the OSPF configuration on R1. This process will allow R1 to announce the default route to other OSPF routers in the network, which then can use it as a gateway of last resort to reach the Internet or other networks not explicitly known to the OSPF domain.
