## AI CERTs AI+ Network Examination Sample Questions (Q22-Q27):

### NEW QUESTION # 22

(How does Python's Netmiko library simplify network automation?)

- A. By managing Kubernetes clusters for container orchestration.
- **B. By supporting multi-vendor environments for device configuration.**
- C. By integrating deep learning algorithms for anomaly detection.
- D. By automating application deployment on cloud platforms.

**Answer: B**

Explanation:

Python's Netmiko library simplifies network automation by supporting multi-vendor environments for device configuration. AI+ Network automation documentation highlights Netmiko as a Python-based abstraction layer built on SSH that enables consistent interaction with network devices from multiple vendors, including Cisco, Juniper, Arista, and HP.

Netmiko removes the complexity of vendor-specific CLI nuances by providing standardized connection methods and command execution functions. This allows network engineers to automate repetitive configuration and validation tasks using a single script rather than maintaining separate workflows for each platform.

Unlike tools focused on AI analytics or container orchestration, Netmiko is purpose-built for network device management, making it ideal for configuration backups, bulk changes, and compliance checks. AI+ Network materials emphasize Netmiko as a foundational automation tool that bridges traditional networking and programmable infrastructure.

### NEW QUESTION # 23

(How does DeepSlice enhance 5G network slicing?)

- A. By focusing on static DNS domain classifications.
- B. By automating penetration testing for security vulnerabilities.
- **C. By using deep learning to optimize load management.**
- D. By preemptively blocking threats to web applications and APIs.

**Answer: C**

Explanation:

DeepSlice enhances 5G network slicing by applying deep learning techniques to optimize load management across network slices. AI+ Network documentation explains that 5G slicing allows multiple virtual networks to operate on the same physical infrastructure, each tailored to specific service requirements such as latency, bandwidth, or reliability.

DeepSlice continuously analyzes traffic demand, user mobility, and application performance metrics. Using deep learning models, it dynamically adjusts resource allocation to ensure each slice receives the appropriate level of service. This improves efficiency, reduces congestion, and maintains Quality of Service (QoS) for diverse use cases such as autonomous vehicles, IoT, and enhanced mobile broadband.

Other options relate to security or DNS analysis and do not address slice optimization. AI+ Network materials identify DeepSlice as a critical innovation for intelligent, adaptive 5G resource management.

### NEW QUESTION # 24

(What is unique about AI's approach to anomaly detection?)

- A. It focuses completely on single-device behavior patterns.
- B. It depends on static rules to flag known threats.
- C. It automates traffic routes based on user input.
- **D. It identifies irregularities using historical and live data.**

**Answer: D**

Explanation:

AI's approach to anomaly detection is unique because it identifies irregularities by analyzing both historical and real-time data. AI+ Network security documentation explains that AI systems learn baseline behavior patterns over time and continuously compare live

traffic against these baselines to detect deviations.

This adaptive learning capability allows AI to identify unknown threats, zero-day attacks, and subtle anomalies that static rule-based systems often miss. Unlike traditional methods that rely on predefined signatures, AI-driven anomaly detection evolves as network behavior changes.

AI does not rely solely on user input or focus only on individual devices; instead, it analyzes patterns across users, applications, and network segments. AI+ Network materials emphasize this holistic, data-driven detection model as a cornerstone of modern, intelligent network security architectures.

#### NEW QUESTION # 25

(How does machine learning predict network traffic patterns?)

- A. By analyzing historical data and identifying trends.
- B. By allocating bandwidth to prioritized applications.
- C. By compressing real-time network traffic logs.
- D. By encrypting traffic flows for secure transmission.

**Answer: A**

Explanation:

Machine learning predicts network traffic patterns by analyzing historical data and identifying trends over time. AI+ Network documentation explains that ML models are trained on past traffic metrics such as bandwidth usage, latency, packet loss, time-of-day patterns, and application behavior.

By learning from this data, machine learning algorithms can forecast future traffic demands, anticipate congestion, and enable proactive network optimization. This predictive capability allows networks to scale resources in advance, adjust routing paths, and maintain consistent Quality of Service (QoS).

Machine learning does not compress traffic or perform encryption directly. While it can inform bandwidth allocation decisions, prediction itself is achieved through pattern recognition and trend analysis. AI+ Network materials emphasize predictive analytics as a core advantage of AI-driven networking solutions.

#### NEW QUESTION # 26

(Why is GNS3 considered superior for advanced network emulation compared to simpler simulators?)

- A. It provides a pre-configured environment for basic networking tasks.
- B. It supports real operating systems for realistic network behavior.
- C. It focuses on simulating Cisco devices.
- D. It requires minimal system resources for complex scenarios.

**Answer: B**

Explanation:

GNS3 is considered superior for advanced network emulation because it supports real network operating systems, providing highly realistic network behavior. According to AI+ Network lab documentation, GNS3 allows engineers to run actual router and switch images, including Cisco IOS, IOS-XE, JunOS, and Linux-based systems, rather than relying on simplified simulations.

This capability enables accurate testing of routing protocols, security features, automation scripts, and failure scenarios exactly as they would behave in production environments. Unlike basic simulators, GNS3 does not abstract protocol behavior, making it ideal for advanced troubleshooting, certification labs, and enterprise network design validation.

While GNS3 can simulate Cisco devices, it is not limited to them. It also requires more system resources, not fewer, due to its realism. Pre-configured environments are typically associated with beginner tools, whereas AI+ Network training emphasizes GNS3 for advanced, real-world emulation and hands-on skill development.
