NEW QUESTION # 143

You have an Azure Synapse Analytics workspace named workspace1 that contains a server less SQL pool.

You have an Azure Table Storage account that stores operational data.

You need to replace the Table storage account with Azure Cosmos DB for NoSQL. The solution must meet the following requirements:

- * Support Queries from the server less SQL pool.
- * Only pay for analytical compute when running queries.
- * Ensure that analytical processes do

NOTE: affect operational processes.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

NEW QUESTION # 144

You have an Azure Cosmos DB for NoSQL account.

You plan to create a container named container1. The container1 container will store items that include two properties named nm and age. The most commonly executed queries will query container1 for a specific name. The following is a sample of the query.

You need to define an opt-in Indexing policy for container1. The solution must meet the following requirements:

- * Minimize the number of request units consumed by the queries.
- * Ensure that the _etag property is excluded from indexing.

How should you define the indexing policy? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

NEW QUESTION # 145

You have an Azure Cosmos DB for NoSQL account named account1 that has a single read-write region and one additional read region. Account1 uses the strong default consistency level.

You have an application that uses the eventual consistency level when submitting requests to account1.

How will writes from the application be handled?

- A. Azure Cosmos DB will reject writes from the application.
- B. Writes will use the eventual consistency level.
- **C. Writes will use the strong consistency level.**
- D. The write order is not guaranteed during replication.

Answer: C

Explanation:

Explanation

This is because the write concern is mapped to the default consistency level configured on your Azure Cosmos DB account, which is strong in this case. Strong consistency ensures that every write operation is synchronously committed to every region associated with your Azure Cosmos DB account. The eventual consistency level that the application uses only applies to the read operations.

Eventual consistency offers higher availability and better performance, but it does not guarantee the order or latency of the reads.

NEW QUESTION # 146

You plan to implement con-iot1 and con-iot2.

You need to configure the default Time to Live setting for each container. The solution must meet the IoT telemetry requirements.

What should you configure? To answer, select the appropriate options in the answer NOTE: Each correct selection is worth one point.
