Pass Guaranteed Salesforce - Fantastic Mule-Dev-202 - Salesforce Certified MuleSoft Hyperautomation Developer Reliable Exam Cost

Even we have engaged in this area over ten years, professional experts never blunder in their handling of the Mule-Dev-202 exam torrents. By compiling our Mule-Dev-202 prepare torrents with meticulous attitude, the accuracy and proficiency of them is nearly perfect. As the leading elites in this area, our Mule-Dev-202 prepare torrents are in concord with syllabus of the exam. They are professional backup to this fraught exam. So by using our Mule-Dev-202 Exam torrents made by excellent experts, the learning process can be speeded up to one week. They have taken the different situation of customers into consideration and designed practical Mule-Dev-202 test braindumps for helping customers save time. As elites in this area they are far more proficient than normal practice materials' editors, you can trust them totally.

Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q50-Q55):

NEW QUESTION # 50

AnyAirlines has MuleSoft Composer installed on their production Salesforce environment.

To test flows with data in multiple non-production environments, what does the hyperautomation specialist need to do?

- A. Install MuleSoft Composer in only one non-production Salesforce environment and create a proxy to all other non-production environments.
- B. Install MuleSoft Composer in each of the non-production Salesforce environments.

- C. Use mocked data because non-production data is not available to MuleSoft Composer.
- **D. Create a connection to each of the non-production environments within the Composer UI.**

Answer: D

Explanation:

Create Connections: To test flows with data in multiple non-production environments, creating connections to each environment within the MuleSoft Composer UI is necessary. This allows the Composer to access and manipulate data across different environments, ensuring comprehensive testing.

Reference: MuleSoft Composer Connections

Installing Composer in Non-Production Environments: While installing Composer in each environment is technically possible, creating individual connections is more efficient and aligns with best practices.

Reference: Composer Setup and Configuration

Using Mocked Data: Mocked data can be useful for initial testing, but connecting to actual non-production environments provides more realistic test scenarios.

Reference: Testing with Mock Data

Proxy Setup: Creating a proxy to other environments is complex and unnecessary when Composer supports direct connections.

Reference: Proxy Configuration

NEW QUESTION # 51

The MuleSoft team at Northern Trail Outfitters wants to create a project skeleton that developers can use as a starting point when creating API implementations with Anypoint Studio. This will help drive consistent use of best practices within the team.

Which type of Anypoint Exchange artifact should be added to Exchange to publish the project skeleton?

- **A. A MuleSoft application template with key components**
- B. RAML trail definitions to be reused across API implementations
- C. A custom asset with the default API implementation
- D. An example of an API implementation following best practices

Answer: A

Explanation:

To create a project skeleton that developers can use as a starting point for API implementations with Anypoint Studio, the best approach is to use a MuleSoft application template:

MuleSoft Application Template:

A MuleSoft application template includes key components and configurations that follow best practices. It provides a consistent starting point for new projects, ensuring that all developers adhere to the same standards.

Benefits:

Using a template helps enforce best practices, reduces the setup time for new projects, and ensures consistency across different implementations.

Publishing to Anypoint Exchange:

Once the template is created, it can be published to Anypoint Exchange where it is accessible to the entire development team.

Developers can then use this template to kickstart their API projects, ensuring a uniform approach across the organization.

NEW QUESTION # 52

AnyAirlines is attempting to automate a process that triggers when a case is created in Salesforce but requires data to be extracted from a website without an API. It plans to automate the process using MuleSoft Composer and MuleSoft RPA.

During the design phase, it uses RPA Recorder to gather the steps required to interact with the website.

What will automatically be gathered by RPA Recorder when recording a manual activity?

- A. Variable information used by the user during the process
- **B. Documentation on the elements used by the user during the process**
- C. Comments on the purpose of the different steps carried out by the user
- D. Conditional decisions made by the user during the process

Answer: B

Explanation:

When using MuleSoft RPA Recorder to gather steps required for interacting with a website, it automatically collects documentation on the elements used by the user during the process.

MuleSoft RPA Recorder:

Automatic Element Documentation: The RPA Recorder captures all the elements (e.g., buttons, fields, and other UI components) that the user interacts with during the manual process recording.

Metadata Collection: It collects metadata such as element IDs, types, and positions, which are essential for accurately replicating the manual actions during automation.

Why Not Other Options:

Variable Information: While variable information is important, it is not the primary focus of the RPA Recorder. Variables can be defined post-recording.

Conditional Decisions: Conditional logic is typically added during the design phase of the RPA script, not during the initial recording.

Comments: User comments on the purpose of steps are not automatically recorded; this information needs to be added manually.

For more detailed information on how MuleSoft RPA Recorder works, refer to MuleSoft's official RPA documentation

NEW QUESTION # 53

Which component of Anypoint Platform is responsible for enforcing API policies?

- A. API Runtime
- B. API Analytics
- C. API Manager
- **D. API Gateway**

Answer: D

Explanation:

The component of Anypoint Platform responsible for enforcing API policies is the API Gateway.

API Gateway:

The API Gateway is a runtime component that enforces policies applied to APIs. It acts as an intermediary that manages API traffic, security, and performance by applying the policies configured in API Manager.

Policies such as rate limiting, security, transformation, and monitoring are enforced at the API Gateway to ensure that APIs are accessed securely and efficiently.

NEW QUESTION # 54

An RPA process is invoked by a MuleSoft Composer flow. The RPA process has a User Task that can take up to 24 hours to complete.

- A. Create a second MuleSoft Composer flow that runs on a schedule and checks if the RPA process is complete.
- B. Using best practices, how should the results be consumed by MuleSoft Composer?
- C. Wait for the RPA process to complete and invoke a second MuleSoft Composer flow via REST API.
- D. Wait for the RPA process to complete and use the results in the same MuleSoft Composer flow.
- **E. Create a second MuleSoft Composer flow that starts when the RPA process is complete.**

Answer: E

Explanation:

When an RPA process involves a User Task that can take a significant amount of time (up to 24 hours) to complete, it is best to use a follow-up mechanism to handle the results once the process is finished:

Second MuleSoft Composer Flow:

Create a second MuleSoft Composer flow that is triggered when the RPA process completes. This ensures that the first flow is not held up while waiting for the long-running RPA process to finish.

The second flow can start based on an event, such as the completion status of the RPA process, ensuring timely and efficient processing of the results.

Trigger Mechanism:

Configure the RPA process to notify MuleSoft Composer when it is complete, possibly using a REST API or another integration method.

Best Practices:

This approach adheres to best practices by keeping flows modular and focused on specific tasks, making them easier to manage and troubleshoot.
