Get Salesforce Arch-303 Practice Test To Gain Brilliant Result [2026]

When you first contact our software, different people will have different problems. Maybe you are not comfortable with our Arch-303 exam question and want to know more about our products and operations. As long as you have questions, you can send e-mail to us, we have online staff responsible for ensuring 24-hour service to help you solve all the problems about our Arch-303 Test

Prep. After you purchase our Arch-303 quiz guide, we will still provide you with considerate services. Maybe you will ask whether we will charge additional service fees.

Salesforce Certified B2C Commerce Architect Sample Questions (Q58-Q63):

NEW QUESTION # 58

A client receives multiple feeds from third parties on the same SFTP location:

- * Product prices (sftp: prod/prices)
- * Stores information (sftp: prod/stores;
- * Product information (sftp: prod/catalog)
- * Categories information (sftp: prod/marketing)
- * Content (sftp: prod/marketing)

Some of the feeds are placed on sftp multiple times a day, as the information is updated in the source system.

The Architect decides to have only two jobs:

- * One that checks and downloads available feeds every hour
- * One that imports the files from Webdav once a day before the data replication, using the standards steps available in the Job Framework Which design is correct for the import Job, taking the steps scope in consideration?

- A. -Four sibling flows execute steps in parallel: import products, stores, price, content-last flow executes steps in sequence: import:categories, reindex
- B. - foursibling flows execute steps in parallel: import products, stores, prices, content- last flow executes steps in sequence import categories, reindex
- C. - four sibling flows execute steps ki parallel: import products, stores, prices, content- fifth flow executes: import categories- last flow executes steps In sequence: reindex
- D. - three siting flows Import steps In parallel: import products, stores, prices- fourth flow executes: import categories- last flow executes steps in sequece: reindex, Import content

Answer: B

Explanation:

This design maximizes efficiency and concurrency. By having the jobs that import products, stores, prices, and content run in parallel, the system can handle multiple data streams simultaneously, reducing total processing time. The sequential execution of importing categories followed by reindexing ensures that all new and updated information is properly indexed and available for site use, following the completion of the import of more frequently updated data. This order respects dependencies between steps and aligns with best practices for handling complex data workflows in B2C Commerce environments.

NEW QUESTION # 59

An Architect is performing an audit of production logs via Log Center and finds some potentially dangerous custom log output.

In which two ways It this log output Improper In a production environment? Choose 2 answers

- A. The log information includes the order number and customer s email, which violates PCI.
- B. The log information includes the customer s cardname as it appears along with the credit card number (PAN), which violates PCI.
- C. Information logs should not be used in a production environment
- D. The log information includes the customer's card CW (card security code) and expiration date, which violates PCI.

Answer: A,B

Explanation:

In a production environment, logging sensitive customer information such as credit card details (PAN, CVV, expiration date) can lead to severe security and compliance issues, specifically violating PCI DSS (Payment Card Industry Data Security Standard) requirements. The standards strictly prohibit the storage of CVV codes and mandate that any PAN displayed must be masked. Storing such data in logs is not only a risk for data breaches but also non-compliance with these standards can lead to penalties.

* Option A: Including the customer's card name along with the full credit card number in logs is a clear violation of PCI DSS requirements, which stipulate that no more than the last four digits of the card number may be displayed.

* Option B: Logging the card security code (CVV) and expiration date is explicitly prohibited by PCI DSS, which requires that sensitive authentication data, including CVV, must never be stored post- authentication, even if it is encrypted.

NEW QUESTION # 60

The Client wants to have a flash sale on a few products every day. These products are sold through B2C Commerce as well as an in-store Point of Sale system that is tied to the same inventory.

An Architect analyzes the following proposed solution:

Inventory feed will continue to run daily but add a web-service call to compare and update B2C Commerce inventory in real time during checkout after a flash product's inventory reaches a threshold.

Which two risks should the Architect communicate to the Client about this solution?

Choose 2 answers

- A. The default rate limiter configuration for the web-service could cause the web-service to return an exception during high traffic.
- B. If the external hosted web-service is unreliable, it could be a point of failure in the site's order placement flow.
- C. If the product inventory threshold that triggers the web service calls is reached too often, it will have a negative impact on site performance.
- D. Because the job would still be configured to run daily there will be a degrade in performance during non-flash sales periods

Answer: A,B

Explanation:

The risks associated with the proposed real-time inventory update solution during flash sales are:

* Option A (The default rate limiter configuration for the web-service could cause the web-service to return an exception during high traffic): This is a critical risk because high traffic during flash sales could exceed the rate limits set for the web-service, leading to exceptions and potentially failing to update inventory in real-time.

* Option B (If the external hosted web-service is unreliable, it could be a point of failure in the site's order placement flow): Reliance on an external web-service for crucial operations like inventory updates introduces a risk of downtime or performance issues if the service is unreliable, directly impacting the ability to complete orders during peak sales periods.

Both risks could severely disrupt operations during critical sales events, suggesting a need for robust contingency plans and potentially reevaluating the solution architecture to ensure reliability.

NEW QUESTION # 61

The client provided these business requirements:

- * The B2C Commerce platform will integrate with the Client's Order Management System (OMS).
- * The OMS supports integration using REST services.
- * The OMS is hosted on the Client's infrastructure.

What configurations are needed for this integration with the OMS?

- A. A service configuration, a service profile configuration, and a user credential configuration.
- B. A service profile configuration, a WAF configuration, and a service credential configuration.
- C. A service configuration, a hostname alias configuration, and a user credential configuration.
- D. A service configuration, a service profile configuration, and a service credential configuration.

Answer: D

Explanation:

For integrating the B2C Commerce platform with the client's OMS using REST services, the required configurations include:

* Service Configuration: This specifies the service endpoints, HTTP methods, and any other service-specific settings necessary for the integration.

* Service Profile Configuration: This defines the behavior of the service such as timeout settings, retry logic, and cache settings.

* Service Credential Configuration: This involves setting up the credentials that will be used to authenticate the requests to the client's OMS. These credentials are often managed securely through encrypted storage and retrieval mechanisms.

These configurations ensure secure, efficient, and reliable communication between the B2C Commerce platform and the client's OMS, adhering to best practices in web service integration.

NEW QUESTION # 62

An Architect to notify by the Business that order conversion dramatically dropped a few hours after go live.

Further investigation points out that customers cannot proceed to checkout anymore. The Architect is aware that a custom inventory check with a third-party API is enforced at the beginning of checkout, and that customers are redirected to the basket page when items are no longer in stock. Which tool can clearly confirm that the problem is indeed caused by the inventory check?

- A. Service Status from Business Manager
- **B. Pipeline Profiler from Business Manager**
- C. Realtime Report from Reports and Dashboards
- D. Sales Dashboard from Reports and Dashboards

Answer: B

Explanation:

The appropriate tool to verify that the problem is indeed caused by the inventory check at the beginning of checkout is the Pipeline Profiler in Business Manager. This tool allows an architect to analyze the performance of specific code execution paths, including those involving third-party API calls. It helps identify bottlenecks and inefficiencies in the pipeline execution, particularly useful in situations where custom code like inventory checks may impact site functionality. The use of the Pipeline Profiler would enable the architect to pinpoint if the custom inventory check is causing the checkout process to fail or redirect users inappropriately.

NEW QUESTION # 63

.....

In addition to the environment, we also provide simulations of papers. You really have to believe in the simulation paper of our Arch-303 study materials. With our Arch-303 practice engine, you can know that practicing the questions and answers are a enjoyable experience and it is an interactive system. If you are answering the questions rightly, then the result will show right, and if you choose the wrong answer, then it will show wrong. And when you finish the Arch-303 Exam Questions, the scores will come up as well.
