VMware 2V0-17.25 Exam Syllabus Topics:

Topic	Details
Topic 1	• VMware Cloud Foundation Fundamentals: This section of the exam measures the skills of Private Cloud Engineers and covers the basic building blocks of VMware Cloud Foundation. It includes the vision and use cases for private cloud, along with the value it provides to businesses. Candidates are expected to understand compute fundamentals such as deploying and managing vCenter, ESXi, clusters, and virtual machines. Storage fundamentals include configuring vSphere storage, setting up vSAN clusters, applying storage policies, and understanding resilience options. Networking fundamentals are also assessed, with a focus on configuring connectivity, fabrics, routing, and network services in a VMware environment.

Topic 2	• IT Architectures, Technologies, Standards: This section of the exam measures the skills of Cloud Architects and focuses on understanding the broader context of IT architectures, common technologies, and industry standards. While it does not have testable objectives, it sets the foundation for how VMware Cloud Foundation aligns with enterprise cloud strategies.
Topic 3	• Deploy, Configure, and Operate VMware Cloud Foundation (VCF): This section of the exam measures the skills of VCF Administrators and goes in-depth into deploying, configuring, and managing VMware Cloud Foundation. The deployment portion covers identifying deployment models, configuring private cloud environments, and setting up workload domains and networking. The management objectives focus on lifecycle operations such as fleet management, identity and role-based access, licensing, certificate handling, and importing existing vCenters. Operations are assessed through capabilities like monitoring health, logs, networks, and storage, along with creating dashboards, configuring alerts, and ensuring compliance. The automation portion evaluates skills in using VCF Automation for multi-tenancy, provider networking, content libraries, governance policies, and extensibility to automate business processes. It also includes knowledge of deploying Supervisor-based services within Cloud Foundation.
Topic 4	• Plan and Design the VMware by Broadcom Solution: This section of the exam measures the skills of Solution Designers and emphasizes the ability to plan and design VMware by Broadcom solutions. Although no testable objectives are defined here, it reinforces the importance of architectural planning and design considerations for large-scale cloud deployments.

VMware Cloud Foundation 9.0 Administrator Sample Questions (Q30-Q35):

NEW QUESTION # 30
Which vSphere feature helps you reclaim idle or unused disk space within guest operating systems by coordinating the hypervisor and OS?

- A. Ballooning
- B. Transparent Page Sharing
- C. Storage I/O Control
- D. UNMAP / Guest OS trim

Answer: D

Explanation:
The UNMAP feature (sometimes referred to as trim for SSDs) reclaims blocks that guest OSes free, updating the storage system so that this space can be reused.

NEW QUESTION # 31
An administrator has deployed a VMware Cloud Foundation (VCF) environment and needs to monitor the health of the environment. Which three components can be monitored using VCF Health in VCF Operations? (Choose three.)

- A. NSX
- B. vCenter Server
- C. VCF Operations for Logs

- D. VCF Operations
- E. ESX hosts
- F. VCF Operations Fleet Management

Answer: A,B,E

Explanation:
The VCF Health feature "provides a central location for monitoring the health of your environment," including the ability to track "vCenter Server instances," "ESXi hosts," and "NSX deployments." Health monitoring includes connectivity, configuration, and critical services status, surfacing alerts for remediation. The documentation's scope statements make clear that VCF Health targets the infrastructure components-vCenter, ESXi, and NSX-rather than the VCF Operations applications themselves (for example, Fleet Management or Logs). Therefore, the correct monitored components are ESX hosts, vCenter Server, and NSX.

NEW QUESTION # 32
An organization has 3 data center sites and is implementing a solution to achieve a Recovery Point Objective (RPO) of 0 to ensure continuous availability of storage in the event of a single site failure. The sites are connected via a high bandwidth/low latency link. Which two VMware Cloud Foundation (VCF) components can be used to support this capability?
(Choose two.)

- A. NSX
- B. vSphere
- C. vSAN
- D. Aria Operations
- E. vSphere Replication

Answer: B,C

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
To achieve an RPO of 0 (zero data loss) with continuous availability of storage across multiple sites, VMware Cloud Foundation leverages two key components:
vSphere (A): vSphere provides the core platform for compute virtualization, including features such as VMware vSphere HA (High Availability) and VMware vSphere Fault Tolerance, both of which are integral to delivering continuous VM availability and supporting cross-site failover.
vSAN (E): vSAN can be configured in a stretched cluster deployment across the three sites. With a stretched vSAN cluster, data is synchronously replicated between sites, ensuring that all writes are committed to more than one location. This synchronous replication provides true continuous availability and a Recovery Point Objective (RPO) of 0 in the event of a single site failure, provided that the network meets high bandwidth and low latency requirements.
Other components such as Aria Operations and NSX do not provide storage-level availability or synchronous data protection.
vSphere Replication only supports asynchronous replication and cannot guarantee RPO of 0.

NEW QUESTION # 33
An administrator is tasked with enabling Workload Management (vSphere Supervisor) on a VMware Cloud Foundation (VCF) workload domain using the SDDC Manager UI.
Which three are prerequisites for enabling Workload Management? (Choose three.)

- A. Verify that the vSphere Distributed Switch is configured with sufficient port groups.
- B. Verify all hosts within the selected Sphere clusters have the proper vSphere with Tanzu licensing to support Workload Management.
- C. Verify that the cluster is running vSAN.
- D. Verify at least one Content Library is available.
- E. Verify at least one NSX Edge cluster is deployed and available.

Answer: A,B,E

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
The official documentation for enabling Workload Management (vSphere Supervisor) on a VCF workload domain requires the following prerequisites:

Verify that the vSphere Distributed Switch is configured with sufficient port groups (A): The vSphere Distributed Switch must have the appropriate port groups created and configured to support the networking requirements of the Supervisor Cluster.
Verify all hosts within the selected Sphere clusters have the proper vSphere with Tanzu licensing to support Workload Management (C): All ESXi hosts in the target cluster must have vSphere with Tanzu licensing to enable and use Workload Management features.
Verify at least one NSX Edge cluster is deployed and available (D): NSX Edge cluster is necessary to provide network services, including load balancing and routing, which are required for the Supervisor Cluster.
A content library is not a prerequisite for enabling Workload Management, and while vSAN is commonly used, it is not a strict requirement for all configurations of Supervisor Clusters.

NEW QUESTION # 34

Which techniques help manage storage performance when multiple VMs compete for I/O on the same datastore?

- A. Using vVols to enable array-based storage QoS
- B. Storage I/O Control (SIOC) to throttle high I/O workloads
- C. Thin provisioning to reduce physical disk usage
- D. Applying Resource Pools to storage for CPU/memory performance

Answer: A,B

Explanation:
SIOC (A) and vVols (C) can limit or manage I/O across VMs. Resource Pools (B) govern CPU/memory, not storage. Thin provisioning (D) saves capacity but doesn't directly control performance.
