New CISM Test Cost & CISM Exam Certification

Actually, CISM exam really make you anxious. You may have been suffering from the complex study materials, why not try our CISM exam software of CertkingdomPDF to ease your burden. Our IT elite finally designs the best CISM exam study materials by collecting the complex questions and analyzing the focal points of the exam over years. Even so, our team still insist to be updated ceaselessly, and during one year after you purchased CISM Exam software, we will immediately inform you once the CISM exam software has any update.

Career Growth

After getting the CISM certificate, one can become an Information System Security Officer, an Information Risk Consultant, or an Information Security Manager. Furthermore, there are different levels starting from the Entry one, which involves a System Analyst, Security Auditor Trainee, etc. Besides that, you can become a Technical Specialist, a Technical Manager, or go for the expert-level positions, which include a Senior IT Systems Professional, a Senior IT Architect, a Development Engineer, etc. Obtaining this ISACA certification can also cause a huge salary bump of around \$128,000 per year, but your salary may vary according to the job title you choose.

ISACA Certified Information Security Manager Sample Questions (Q804-Q809):

NEW QUESTION # 804

An organization is aligning its incident response capability with a public cloud service provider. What should be the information security manager's FIRST course of action?

- A. Update the incident escalation process.
- B. Review the provider's incident definitions and notification criteria.
- C. Identify the skill set of the provider's incident response team.
- D. Evaluate the provider's audit logging and monitoring controls.

Answer: A

Explanation:

Reviewing the provider's incident definitions and notification criteria is the FIRST course of action when aligning the organization's incident response capability with a public cloud service provider. This is because the organization needs to understand how the provider defines and classifies incidents, what their roles and responsibilities are, and how they will communicate with the organization in case of an incident. This will help the organization align its own incident response processes and expectations with the provider's and ensure a coordinated and effective response.

NEW QUESTION # 805

Which of the following should be the PRIMARY basis for the development of a business case to obtain support for an information security project?

- A. Risk tolerance levels
- B. Budgetary requirements
- C. Feasibility study
- D. Enterprise architecture (EA)

Answer: A

Explanation:

Risk tolerance levels (D) should be the primary basis for an information security business case because security investments are justified by their ability to reduce risk to levels acceptable to the organization. CISM stresses that security exists to manage risk in alignment with business objectives and appetite. Budget (A), feasibility (B), and EA alignment (C) are important considerations, but they are secondary to demonstrating how a proposed initiative addresses risks that exceed tolerance. A strong business case clearly articulates the current risk exposure, the residual risk after implementation, and how the investment aligns with executive- defined tolerance thresholds. This approach directly supports informed decision-making by senior management.

NEW QUESTION # 806

An organization recently updated and published its information security policy and standards. What should the information security manager do NEXT?

- A. Develop a policy exception process.
- B. Update the organization's risk register.
- C. Conduct a risk assessment.
- D. Communicate the changes to stakeholders.

Answer: D

NEW QUESTION # 807

A Seat a-hosting organization's data center houses servers, appli
BEST approach for developing a physical access control policy for the organization?

- A. Design single sign-on (SSO) or federated access.
- B. Review customers' security policies.
- C. Conduct a risk assessment to determine security risks and mitigating controls.
- D. Develop access control requirements for each system and application.

Answer: C

Explanation:

= The best approach for developing a physical access control policy for the organization is to conduct a risk assessment to determine the security risks and mitigating controls that are relevant and appropriate for the organization's data center. A risk assessment is a process of identifying, analyzing, and evaluating the information security risks that could affect the availability, integrity, or confidentiality of the servers, applications, and data that are hosted in the data center. A risk assessment can help to determine the likelihood and impact of the unauthorized or inappropriate physical access to the data center, such as theft, damage, sabotage, or espionage, and the potential consequences for the organization and its customers, such as service disruption, data loss, data breach, or legal liability. A risk assessment can also help to identify and prioritize the appropriate risk treatment options, such as implementing technical, administrative, or physical controls to prevent, detect, or respond to the physical access incidents, such as locks, alarms, cameras, guards, badges, or logs. A risk assessment can also help to communicate and report the risk level and status to the senior management and the relevant stakeholders, and to provide feedback and recommendations for improvement and optimization of the physical access control policy and the risk management process.

Reviewing customers' security policies, developing access control requirements for each system and application, and designing single sign-on (SSO) or federated access are all possible steps that the organization can take after conducting the risk assessment, but they are not the best ones. Reviewing customers' security policies is a process of understanding and complying with the customers' expectations and requirements for the security of their servers, applications, and data that are hosted in the data center, and ensuring that the organization's physical access control policy is consistent and compatible with them. Developing access control requirements for each system and application is a process of defining and implementing the specific rules and criteria for granting or denying the physical access to the servers and applications that are hosted in the data center, based on the roles, responsibilities, and privileges of the users, and the sensitivity and criticality of the systems and applications. Designing single sign-on (SSO) or federated access is a process of enabling and facilitating the authentication and authorization of the users who need to access the servers and applications that are hosted in the data center, by using a single or shared identity and credential across multiple systems and domains.
