Just like the old saying goes, motivation is what gets you started, and habit is what keeps you going. A good habit, especially a good study habit, will have an inestimable effect in help you gain the success. The CGOA exam prep from our company will offer the help for you to develop your good study habits. If you buy and use our study materials, you will cultivate a good habit in study. More importantly, the good habits will help you find the scientific prop learning methods and promote you study efficiency, and then it will be conducive to helping you pass the CGOA Exam in a short time. So hurry to buy the CGOA test guide from our company, you will benefit a lot from it.

## Linux Foundation Certified GitOps Associate Sample Questions (Q50-Q55):

NEW QUESTION # 50

In a GitOps-managed workflow, what is the correct way to initiate rollback?

- A. Use Helm to rollback to a previous release version.
- B. Overwrite your existing version with the code from your last working version.
- **C. Create a new version based on a former version so you always "roll forward".**
- D. Revert to an older version and force push to the main branch.

**Answer: C**

Explanation:

In GitOps, rollback is handled via version control. However, the practice is not to overwrite history but to roll forward by creating a new version that reverts to the configuration of a previous known-good commit. This maintains immutability and a complete audit trail.

"With GitOps, changes are versioned immutably. Rollbacks are performed by rolling forward to a commit that represents a previous known-good configuration, ensuring history is preserved." Thus, the correct GitOps approach is B.

### NEW QUESTION # 51

In the context of GitOps, which of the following is the primary purpose of Desired State?

- A. To store all persistent application data, such as database content.
- B. To track code changes that developers have made.
- **C. To serve as a blueprint to recreate a system for behavioral consistency.**
- D. For monitoring real-time application performance.

**Answer: C**

Explanation:

The Desired State in GitOps is the declarative specification of how the system should behave. It is stored in Git and serves as the reference point for reconciliation against the actual state.

"The desired state is a complete specification of the system stored in Git. It acts as the blueprint from which the actual state is continuously reconciled, ensuring the system remains consistent and reproducible." Thus, the primary purpose of Desired State is to act as a blueprint to recreate and ensure consistency of the system.

References: GitOps Terminology (CNCF GitOps Working Group).

### NEW QUESTION # 52

You are implementing GitOps in your organization and have configured the Desired State of your applications in a Git repository. However, during the deployment process, you encounter an error in the configuration. What is the recommended action in this scenario?

- A. Raise a ticket with the development team to fix the error in the configuration file.
- B. Continue to monitor the issue and proceed with the deployment, as it may not significantly impact the application.
- **C. Roll back the deployment to the previous working version while investigating the error in the configuration file.**
- D. Make a call to the Kubernetes API with the correction.

**Answer: C**

Explanation:

GitOps emphasizes immutability and auditability. If an error occurs in the configuration stored in Git, the system should be rolled back to the last known good state while the error is fixed. This preserves system reliability and aligns with the GitOps principle of rollback through version control.

"With Git as the source of truth, if an error is introduced, the system can be rolled back by reverting to a previous commit. This ensures stability while the faulty configuration is corrected." Thus, the recommended action is C: Roll back to the previous working version.

References: GitOps Principles (CNCF GitOps Working Group).

### NEW QUESTION # 53

In GitOps, how are the Desired State declarations pulled from the source?

- A. With a CLI command or API call.
- **B. Automatically by software agents.**
- C. By sending a request to the source repository.
- D. Manually triggered by a webhook.

**Answer: B**

Explanation:

A fundamental GitOps principle is that reconciliation is automated and continuous. Software agents (e.g., controllers like ArgoCD or Flux) continuously pull desired state declarations from Git repositories and reconcile them with the actual state.

"Software agents automatically pull the desired state declarations from the source of truth and continuously reconcile the actual state to match." Thus, the correct answer is C.

References: GitOps Principles (CNCF GitOps Working Group), Principle 4: Continuously reconciled.

#### NEW QUESTION # 54

What is one of the key benefits of a pull-based reconciliation approach to configuration management?

- A. Simplified troubleshooting and debugging processes.
- B. The CI has access credentials to the running system.
- C. Immediate response time to configuration changes.
- **D. Agents can access the Desired State at any time, not only when an event is triggered.**

**Answer: D**

Explanation:

In GitOps, the pull-based reconciliation approach means that agents continuously monitor the Desired State in Git. Unlike push-based systems, which only act when triggered, pull-based systems can reconcile at any time, providing resilience, self-healing, and security (since no external system needs direct access to the cluster).

"In a pull-based model, reconciliation agents continuously fetch and compare the desired state, enabling self-healing and ensuring the desired configuration is accessible at all times." Thus, the correct answer is B.
