Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q70-Q75):

NEW QUESTION # 70

What are two link state routing protocols? (Choose two.)

- A. OSPF
- B. IS-IS
- C. EBGp
- D. IBGP

Answer: A,B

Explanation:

Link-state routing protocols exchange information about the state of network links to determine the best path to a destination. These protocols maintain a complete view of the network topology.

A). IS-IS (Intermediate System to Intermediate System): IS-IS is a link-state routing protocol used in large-scale networks. It builds a complete topology map of the network and calculates the shortest path using algorithms like Dijkstra.

B). OSPF (Open Shortest Path First): OSPF is another link-state routing protocol, widely used in IP networks. Like IS-IS, it uses a link-state database and Dijkstra's algorithm to calculate the shortest path.

NEW QUESTION # 71

Which component is considered part of the data plane?

- **A. the Packet Forwarding Engine**
- B. the fan tray
- C. the Routing Engine
- D. the power supply

Answer: A

Explanation:

The Packet Forwarding Engine (PFE) is an integral component of Juniper Networks devices, responsible for the data plane operations. The data plane, also known as the forwarding plane, is where the actual processing and forwarding of packets occur based on the routing and forwarding tables. The PFE executes the forwarding decisions made by the Routing Engine (RE), handling all packet transmissions, including routing, filtering, and switching packets towards their destination. This contrasts with the control plane operations handled by the RE, which involve routing table maintenance, system management, and control protocol processing.

NEW QUESTION # 72

You are asked to configure your device running Junos OS to automatically archive your configuration upon commit. In this scenario, which two methods are supported by the Junos OS?

(Choose two)

- **A. SCP**
- B. HTTP
- **C. FTP**
- D. RCP

Answer: A,C

Explanation:

Junos OS supports several methods for automatically archiving configurations upon commit. The supported methods are:

A). SCP (Secure Copy Protocol): SCP is a secure method for transferring files, including configurations, between devices. It is supported by Junos OS for archiving configurations after each commit.

C). FTP (File Transfer Protocol): FTP can also be used for transferring and archiving files, including configurations, after a commit in Junos OS.

NEW QUESTION # 73

What are two methods for navigating to configuration mode from an operational mode prompt?

(Choose two.)

- A. Use the exit command.
- B. Use the quit command.
- **C. Use the edit command.**
- **D. Use the configure command.**

Answer: C,D

Explanation:

In Junos OS, to navigate from operational mode to configuration mode, you can use either the edit or configure command. Both commands move the CLI from operational mode, where you can view the state of the device, to configuration mode, where you can make changes to the device's configuration.

NEW QUESTION # 74

What are two examples of exception traffic? (Choose two.)

- A. ping to the local device
- B. transit packets
- C. routing updates
- D. log messages

Answer: A,C

Explanation:

Exception traffic is traffic that requires special handling by the Routing Engine (RE) rather than being simply forwarded by the Packet Forwarding Engine (PFE). This type of traffic is generally meant for the device itself rather than for transit through the device.

routing updates: Routing protocol updates (such as OSPF, BGP, or RIP) are destined for the Routing Engine because they are processed by the control plane to maintain the routing table.

Thus, they are also considered exception traffic.

ping to the local device: When you ping the local device (the router or switch itself), the packet is directed to the Routing Engine, as it requires a response from the device. This is an example of exception traffic.

NEW QUESTION # 75
