Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q89-Q94):

NEW QUESTION # 89
How does Azure support high-availability in VPN deployments?
Response:

- A. By using redundant VPN devices
- B. Through automatic scaling
- C. Through geo-redundancy
- D. By allowing multiple VPN gateways per subscription
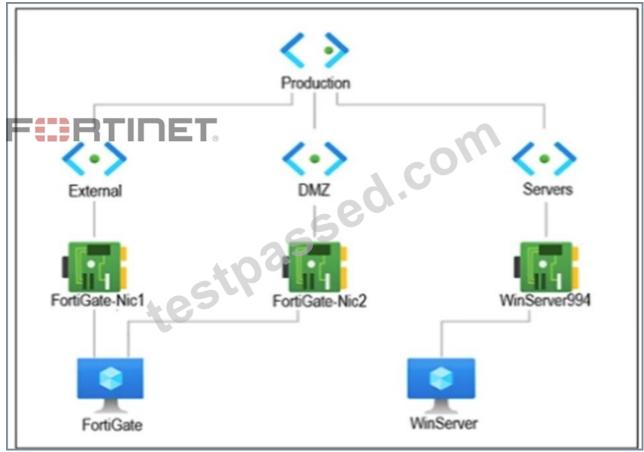

Answer: A

NEW QUESTION # 90
How does autoscaling enhance HA for applications hosted in Azure?
Response:

- A. By automatically adjusting the bandwidth
- B. By encrypting data transfers
- C. By adding or removing resources based on demand
- D. By shifting traffic to underutilized servers

Answer: C

NEW QUESTION # 91
Refer to the exhibit.

You are troubleshooting a network connectivity issue between two VMs that are deployed in Azure.
One VM is a FortiGate that has one interface in the DMZ subnet, which is in the Production VNet. The other VM is a Windows Server in the Servers subnet, which is also in the Production VNet. You cannot ping the Windows Server from the FortiGate VM.
What is the reason for this?

- A. The firewall in the Windows VM is blocking the traffic
- B. You have not configured a user-defined route for this traffic
- C. You have not created a VPN to allow traffic between those subnets
- D. By default, Azure does not allow ICMP traffic between subnets

Answer: A

Explanation:
The FortiGate VM and the Windows Server VM are in different subnets but within the same Production virtual network, which means they can communicate by default unless restricted. Azure allows ICMP between subnets, but Windows VMs have ICMP blocked by default in their firewall settings. Therefore, the likely reason for the ping failure is that the Windows Server's firewall is blocking ICMP (ping) traffic.

NEW QUESTION # 92
Which operational capability does FortiWeb provide when deployed in an Azure cloud environment?
Response:

- A. Physical network monitoring
- B. VPN connectivity enhancement
- C. Distributed Denial of Service (DDoS) mitigation
- D. Wireless access management

Answer: C
