solutions.

Salesforce Certified Sharing and Visibility Architect Sample Questions (Q61-Q66):

NEW QUESTION # 61

Which users have access to Opportunity records owned by an external user, assuming no other changes to the sharing model have been implemented?

- A. The record owner and any user below the external user in the role hierarchy.
- **B. The record owner and any user above the external user in the role hierarchy.**
- C. The record owner and all internal users.
- D. The record owner only.

Answer: B

Explanation:

Explanation

The record owner and any user above the external user in the role hierarchy have access to opportunity records owned by an external user. This is because external users are always at the bottom of the role hierarchy and do not grant access to users below them. The record owner and all internal users do not have access to opportunity records owned by an external user unless they have other sharing mechanisms such as sharing rules or manual sharing

NEW QUESTION # 62

Universal Containers (UC) has a custom Apex class that enforces a business process and updates opportunities. UC has noticed that fields with Field-Level Security permission of Read-Only on certain users' profiles are being updated by this class. How should the architect fix this problem?

- A. Add the With Sharing keyword to the class.
- B. Put the code in an inner class that uses the With Sharing keyword.
- **C. Use the IsUpdateable() Apex method to test each field prior to allowing update.**

Answer: C

Explanation:

In Apex, the IsUpdateable() method of the Schema.DescribeFieldResult class checks if the current user has permission to update a specific field. Using this method ensures that the Apex class respects Field-Level Security (FLS) for all profiles, avoiding unauthorized updates.

* Option A: Adding the "With Sharing" keyword enforces record-sharing rules but does not enforce field-level security.

* Option B: Placing the code in an inner class with "With Sharing" does not address the field-level security issue.

* Option C (Correct): Using IsUpdateable() ensures field permissions are honored programmatically, preventing updates to read-only fields.

:

Schema.DescribeFieldResult Methods
Enforcing Field-Level Security in Apex

NEW QUESTION # 63

For the Universal Containers Commercial and Consumer support departments, having access to Activities for Contacts with which they interact is important. Commercial support users should not see Consumer Accounts/Contacts and Consumer support users should not see Commercial Accounts/Contacts. Assuming the Organization-Wide Default for Activities is set to "Controlled by Parent" what is the minimum level of Sharing access a support user would need to Accounts/Contacts to view associated Activities?

- A. Private Account/Contact Sharing Default with a Sharing Rule for each department set to Private access to Accounts/Contacts.
- **B. Private Account/Contact Sharing Default with a Sharing Rule for each department set to Public Read only access to Accounts/Contacts.**
- C. The users need no access to Accounts/Contacts with the proper Activity Sharing Rules and Profile Permissions for the Accounts Tab.

- D. Private Account/Contact Sharing Default with a Sharing Rule for each department set to Public Read/Write access to Accounts/Contacts.

Answer: B

NEW QUESTION # 64

Universal Containers (UC) has a custom Apex class that enforces a business process and updates opportunities. UC has noticed that fields with Field-Level Security permission of Read-Only on certain users' profiles are being updated by this class. How should the architect fix this problem?

- A. Add the With Sharing keyword to the class.
- B. Put the code in an inner class that uses the With Sharing keyword.
- C. Use the IsUpdateable() Apex method to test each field prior to allowing update.

Answer: C

NEW QUESTION # 65

Assuming granular locking is enabled, what activity can happen in parallel to changing a community account owner without risking group membership lock errors?

- A. Creation of a Territory
- B. Creation of a Role
- C. Deletion of a Role
- D. Deletion of a Territory

Answer: A

Explanation:

Explanation

Creating a territory is an activity that can happen in parallel to changing a community account owner without risking group membership lock errors, assuming granular locking is enabled. Granular locking is a feature that allows for concurrent sharing operations on different objects or groups, reducing lock contention and improving performance. Deletion or creation of a role is an activity that can cause group membership lock errors, as it affects the role hierarchy and all the groups that are associated with it. Deletion of a territory is also an activity that can cause group membership lock errors, as it affects the territory hierarchy and all the groups that are associated with it
