Moreover, we offer free Amazon AWS-Solutions-Architect-Professional Exam Questions updates if the AWS-Solutions-Architect-Professional actual test content changes within 12 months of your buying. Our AWS-Solutions-Architect-Professional guide questions have helped many people obtain an international certificate. In this industry, our products are in a leading position in all aspects.

Earning the AWS-Solutions-Architect-Professional certification is a great way to demonstrate your expertise in designing and deploying enterprise-level applications on AWS. It also helps you stand out from the competition and increase your earning potential. Additionally, AWS certification holders have access to exclusive resources, such as a digital badge, a certification logo, and a listing in the AWS Certified Directory, which can help you showcase your skills to potential employers and clients.

The AWS-Solutions-Architect-Professional Certification Exam is a computer-based exam that consists of 75 multiple-choice and multiple-response questions. AWS-Solutions-Architect-Professional exam is designed to test the candidate's ability to design and deploy scalable, highly available, and fault-tolerant systems on AWS infrastructure. AWS-Solutions-Architect-Professional exam is proctored and is available in multiple languages.

Free PDF 2026 Authoritative Amazon AWS-Solutions-Architect-Professional PDF

You can make your dream of passing the Amazon AWS-Solutions-Architect-Professional exam come true with iPassleader updated Amazon AWS-Solutions-Architect-Professional practice test questions. iPassleader offer Amazon AWS-Solutions-Architect-Professional the latest dumps in three formats. Amazon AWS-Solutions-Architect-Professional desktop practice test software creates a real exam environment so that you can feel like attempting the AWS Certified Solutions Architect - Professional AWS-Solutions-Architect-Professional actual exam.

Amazon AWS Certified Solutions Architect - Professional Sample Questions (Q310-Q315):

NEW QUESTION # 310

A company wants to ensure that the workloads for each of its business units have complete autonomy and a minimal blast radius in AWS. The Security team must be able to control access to the resources and services in the account to ensure that particular services are not used by the business units.

How can a Solutions Architect achieve the isolation requirements?

- A. Create individual accounts for each business unit. Federate each account with an IdP and create separate roles and policies for business units and the Security team
- B. Create one shared account for the entire company. Create individual IAM policies and resource tags for each business unit. Federate the account with an IdP, and create separate roles for the business units and the Security team
- C. Create individual accounts for each business unit and add the account to an OU in AWS Organizations. Modify the OU to ensure that the particular services are blocked. Federate each account with an IdP, and create separate roles for the business units and the Security team
- D. Create one shared account for the entire company. Create separate VPCs for each business unit. Create individual IAM policies and resource tags for each business unit. Federate each account with an IdP, and create separate roles for the business units and the Security team

Answer: C

Explanation:

The best way is to use SCP and individual account.

B: This is difficult to manage.

C\D: Does not reduce the blast radius.

NEW QUESTION # 311

An application is running on Amazon EC2 instances. Sensitive information required for the application is stored in an Amazon S3 bucket. The bucket needs to be protected from internet access while only allowing services within the VPC access to the bucket. Which combination of actions should solutions architect take to accomplish this? (Choose two.)

- A. Create a VPC endpoint for Amazon S3.
- B. Add an S3 ACL to the bucket that has sensitive information.
- C. Enable server access logging on the bucket.
- D. Apply a bucket policy to restrict access to the S3 endpoint.
- E. Restrict users using the IAM policy to use the specific bucket.

Answer: A,D

NEW QUESTION # 312

A gaming company created a game leaderboard by using a Multi-AZ deployment of an Amazon RDS database. The number of users is growing, and the queries to get individual player rankings are getting slower over time. The company expects a surge in users for an upcoming version and wants to optimize the design for scalability and performance.

Which solution will meet these requirements?

- A. Migrate the database to Amazon DynamoDB. Store the leader different tables. Use Apache HiveQL JOIN statements to build the leaderboard
- B. Stream the leaderboard data by using Amazon Kinesis Data Firehose with an Amazon S3 bucket as the destination. Query the S3 bucket by using Amazon Athena for the leaderboard.
- C. Keep the leaderboard data in the RDS DB instance. Provision a Multi-AZ deployment of an Amazon ElastiCache for Redis cluster.
- D. Add a read-only replica to the RDS DB instance. Add an RDS Proxy database proxy.

Answer: B

NEW QUESTION # 313

A company is running a batch analysis every hour on their main transactional DB, running on an RDS MySQL instance, to populate their central Data Warehouse running on Redshift. During the execution of the batch, their transactional applications are very slow. When the batch completes they need to update the top management dashboard with the new data. The dashboard is produced by another system running on-premises that is currently started when a manually-sent email notifies that an update is required. The on-premises system cannot be modified because it is managed by another team.

How would you optimize this scenario to solve performance issues and automate the process as much as possible?

- A. Create an RDS Read Replica for the batch analysis and SQS to send a message to the on-premises system to update the dashboard.
- **B. Replace RDS with Redshift for the batch analysis and SNS to notify the on-premises system to update the dashboard**
- C. Create an RDS Read Replica for the batch analysis and SNS to notify me on-premises system to update the dashboard
- D. Replace RDS with Redshift for the oaten analysis and SQS to send a message to the on-premises system to update the dashboard

Answer: B

NEW QUESTION # 314

A company has multiple business units that each have separate accounts on AWS. Each business unit manages its own network with several VPCs that have CIDR ranges that overlap. The company's marketing team has created a new internal application and wants to make the application accessible to all the other business units.

The solution must use private IP addresses only.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Create an Amazon EC2 instance to serve as a virtual appliance in the marketing account's VPC. Create an AWS Site-to-Site VPN connection between the marketing team and each business unit's VPC. Perform NAT where necessary.
- B. Create a Network Load Balancer (NLB) in front of the marketing application in a private subnet. Create an API Gateway API. Use the Amazon API Gateway private integration to connect the API to the NLB. Activate IAM authorization for the API. Grant access to the accounts of the other business units.
- C. Instruct each business unit to add a unique secondary CIDR range to the business unit's VPC. Peer the VPCs and use a private NAT gateway in the secondary range to route traffic to the marketing team.
- **D. Create an AWS PrivateLink endpoint service to share the marketing application. Grant permission to specific AWS accounts to connect to the service. Create interface VPC endpoints in other accounts to access the application by using private IP addresses.**

Answer: D

Explanation:

With AWS PrivateLink, the marketing team can create an endpoint service to share their internal application with other accounts securely using private IP addresses. They can grant permission to specific AWS accounts to connect to the service and create interface VPC endpoints in the other accounts to access the application by using private IP addresses. This option does not require any changes to the network of the other business units, and it does not require peering or NATing. This solution is both scalable and secure.
