## 最新的 Isaca Certification CDPSE 免費考試真題 (Q147-Q152):

### 問題 #147

Which of the following vulnerabilities is MOST effectively mitigated by enforcing multi-factor authentication to obtain access to personal information?

- A. End users using weak passwords
- B. Organizations using weak encryption to transmit data
- C. End users forgetting their passwords
- D. Vulnerabilities existing in authentication pages

答案：A

### 問題 #148

Which of the following would BEST ensure privacy when utilizing AI-based technologies?

- A. Encryption
- B. Masking
- C. Pseudonymization

- **D. Minimization**

答案： D

解題說明：

Data minimization requires collecting and using only what is necessary for the stated purpose—directly limiting privacy risk in AI development and use. Encryption (A) and masking (D) protect data post-collection, and pseudonymization (B) reduces identifiability but does not limit collection or use. Minimization addresses privacy by default at the source.

"Collect and process no more personal data than necessary for the specified purpose."

問題 #149

Which of the following is the PRIMARY reason that organizations need to map the data flows of personal data?

- A. To evaluate effectiveness of data controls
- B. To comply with regulations
- **C. To assess privacy risks**
- D. To determine data integration gaps

答案： C

問題 #150

Which of the following is the PRIMARY reason to use public key infrastructure (PKI) for protection against a man-in-the-middle attack?

- A. It provides a secure connection on an insecure network
- B. It contains schemes for revoking keys.
- C. It uses Transport Layer Security (TLS).
- **D. It makes public key cryptography feasible.**

答案： D

解題說明：

Public key infrastructure (PKI) is a system that enables the use of public key cryptography, which is a method of encrypting and authenticating data using a pair of keys: a public key and a private key. Public key cryptography can protect against man-in-the-middle (MITM) attacks, which are attacks where an attacker intercepts and modifies the communication between two parties. PKI makes public key cryptography feasible by providing a way to generate, distribute, verify, and revoke public keys. PKI also uses digital certificates, which are documents that bind a public key to an identity, and certificate authorities, which are trusted entities that issue and validate certificates. By using PKI, the parties can ensure that they are communicating with the intended recipient and that the data has not been tampered with by an attacker.
