問題 #46

What is true regarding 802.11k?

- A. It extends radio measurements to define mechanisms for wireless network management of stations
- B. It reduces roaming delay by pre-authenticating clients with multiple target APs before a client roams to an AP
- C. It considers several metrics before it determines if a client should be steered to the 5GHz band, including client RSSI
- **D. It provides mechanisms for APs and clients to dynamically measure the available radio resources.**

答案：D

解題說明：

Explanation

802.11k is a standard that provides mechanisms for APs and clients to dynamically measure the available radio resources in a wireless network. 802.11k defines radio resource management (RRM) functions, such as neighbor reports, link measurement, beacon reports, etc., that allow APs and clients to exchange information about the RF environment and make better roaming

decisions. The other options are incorrect because they describe other standards, such as 802.11r, 802.11v, or 802.11ax.

問題 #47

Select the Aruba stacking technology matching each option (Options may be used more than once or not at all.)

答案:

解題說明:

Explanation:

- a) Support up to 10 devices per stack -> VSF
- b) Support two devices per stack -> VSX
- c) Individual ISL links up to 400G are supported -> VSX
- d) individual ISL links up to 50G are supported -> VSF
- e) A maximum aggregate ISL bandwidth of 200G is supported -> VSF

問題 #48

What is a primary benefit of BSS coloring?

- A. BSS color tags are applied on the wireless controllers and can reduce the threshold for interference_
- B. BSS color tags improve security by identifying rogue APS and tagging them as threats.
- C. BSS color tags improve performance by allowing APS on the same channel to be farther apart
- **D. BSS color tags are applied to Wi-Fi channels and can reduce the threshold for interference**

答案: D

解題說明:

Explanation

The primary benefit of BSS coloring is D. BSS color tags are applied to Wi-Fi channels and can reduce the threshold for interference.

BSS coloring is a mechanism that allows Wi-Fi 6 devices to mark each frame with a color code that identifies the BSS (Basic Service Set) it belongs to. This helps differentiate between frames from different BSSs that share the same channel and avoid unnecessary collisions and backoffs. BSS coloring also introduces an adaptive threshold for interference, which means that Wi-Fi 6 devices can adjust the signal strength value that determines whether a channel is busy or not based on the current network environment. This allows for more efficient use of spectrum and higher throughput in dense scenarios¹².

問題 #49

Which statements are true regarding a VXLAN implementation on Aruba Switches? (Select two.)

- A. All Aruba CX switches support VXLAN.
- B. VNIs encapsulate and decapsulate VXLAN traffic
- **C. VTEPs encapsulate and decapsulate VXLAN traffic**
- **D. MTU size must be increased beyond the default**
- E. They are only available for datacenter switches (CX 8k, 9k, 10k)

答案: C,D

問題 #50

A system engineer needs to preconfigure several Aruba CX 6300 switches that will be sent to a remote office. An untrained local field technician will do the rollout of the switches and the mounting of several AP-515s and AP-575S. Cables running to the APs are not labeled.

The VLANs are already preconfigured to VLAN 100 (mgmt), VLAN 200 (clients), and VLAN 300 (guests) What is the correct configuration to ensure that APs will work properly?

- A. ☐
- B. ☒
- C. ☐
- D. ☐

答案：B

解題說明：

Explanation

Option C is the correct configuration to ensure that APs will work properly. It uses the ap command to configure a port profile for APs with VLAN 100 as the native VLAN and VLAN 200 and 300 as tagged VLANs. It also enables LLDP on the ports to discover the APs and assign them to the port profile automatically. The other options are incorrect because they either do not use the ap command, do not enable LLDP, or do not configure the VLANs correctly. References:
