software and a Web-based Salesforce Certified Development Lifecycle and Deployment Architect (Development-Lifecycle-and-Deployment-Architect) practice exam.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q51-Q56):

NEW QUESTION # 51

Universal Containers (UC) is planning for a huge data migration from a home-grown on-premise system to Salesforce as part of their Service Cloud Implementation. UC has approximately 5 million customers, 10 million contacts, and 30 million active cases. Which are the three key areas that should be tested as part of Data Migration? Choose 3 answers

- A. Case assignment rules and escalation rules.
- B. Case association with correct contact and Account.
- C. Case Ownership along with associated entitlement and milestones.
- D. Page Layout assignment to the profiles
- E. Data transformation against the source system

Answer: B,C,E

Explanation:

Explanation

These are the correct answers because they are related to the data quality and integrity of the migrated data.

Case association, case ownership, and data transformation are all important aspects of data migration that should be tested. Case assignment rules and escalation rules are not directly related to data migration, but rather to the business logic and workflow of the application. Page layout assignment is also not related to data migration, but rather to the user interface and security of the application.

NEW QUESTION # 52

Universal Containers (UC) is preparing for the new Salesforce release in a couple of months, and has several ongoing development projects that may be affected. Which three steps should the team at UC take to prepare for this release? Choose 3 answers

- A. Contact Salesforce to schedule a time to upgrade the full Sandbox.
- B. Upgrade any SOAP integrations to the newest WSDL as early as possible
- C. Review the release notes for automatically-enabled features and technical debt.
- D. Refresh a Sandbox during the Release Preview Window to ensure they have the upcoming release.
- E. Run regression tests in an upgraded sandbox to detect any issues with the Upgrade.

Answer: C,D,E

Explanation:

Explanation

Refreshing a sandbox during the release preview window to ensure they have the upcoming release is a step that the team at UC should take to prepare for the new Salesforce release, as it allows them to test their application in an environment that matches the production environment after the upgrade. Running regression tests in an upgraded sandbox to detect any issues with the upgrade is also a step that the team at UC should take to prepare for the new Salesforce release, as it helps them to verify that the existing functionality is not affected by the new features or changes introduced by the upgrade. Reviewing the release notes for automatically-enabled features and technical debt is also a step that the team at UC should take to prepare for the new Salesforce release, as it helps them to understand the impact and benefits of the new features or changes, as well as to identify and resolve any technical debt that may cause issues or conflicts with the upgrade. Contacting Salesforce to schedule a time to upgrade the full sandbox is not a step that the team at UC should take to prepare for the new Salesforce release, as it is not possible to request a specific time for the upgrade of the full sandbox, which is determined by Salesforce and depends on the release window and the pod assignment. Upgrading any SOAP integrations to the newest WSDL as early as possible is not a step that the team at UC should take to prepare for the new Salesforce release, as it is not necessary to upgrade the SOAP integrations to the newest WSDL, unless they want to use the new features or fields introduced by the upgrade. The SOAP integrations will continue to work with the previous WSDL versions, as they are backward compatible.

NEW QUESTION # 53

Universal Containers (UC) has a recruiting application using Metadata API version 35, and deployed it in production last year. The

current Salesforce platform is running on API version 36. A new field has been introduced on the object Apex page in API version 36. A UC developer has developed a new Apex page that contains the new field and is trying to deploy the page using the previous deployment script that uses API version 35. What will happen during the deployment?

- A. The deployment script will pass because the new field is backward compatible with the previous API version 35.
- B. The deployment script will pass because the new field is supported on the current platform version.
- **C. The deployment script will fail because the new field is not known for the previous API version 35.**
- D. The deployment script will fail because the platform doesn't support the previous API version 35.

Answer: C

NEW QUESTION # 54

Universal Containers has five development teams. The performance of the teams has been good, but the number of bugs has been increasing. After each sprint, they need more time to understand the code and make changes.

What are two ways to improve the performance?

Choose 2 answers

- A. Version control system to identify who is generating the bugs.
- B. Define a team that will analyze/approve all changes.
- **C. Sprint review process.**
- **D. Define and follow code standards.**

Answer: C,D

NEW QUESTION # 55

Universal Containers is building a new complex integration to a legacy system. The legacy system is also going through a major upgrade. Senior leadership has committed to the board that the combined programs will be completed on time. What is the risk with this plan?

- A. The deadline is scheduled during a Salesforce release
- **B. Multiple work -streams with dependencies could impact the go-live**
- C. The project team has decided to use the Waterfall methodology
- D. The legacy system team is using an Agile methodology

Answer: B

NEW QUESTION # 56

.....

It is very necessary for a lot of people to attach high importance to the Development-Lifecycle-and-Deployment-Architect exam.
