問題 #25

Which Anypoint Platform component should a MuleSoft developer use to create an API specification prior to building the API implementation?

- A. API Manager
- **B. API Designer**
- C. Runtime Manager
- D. MUnit

答案： B

解題說明：

Creating an API specification before building the API implementation is a critical step in API development. MuleSoft's API Designer is the tool designed for this purpose. Here's a detailed explanation:

API Designer:

Purpose: API Designer is a web-based tool within Anypoint Platform that allows developers to design, document, and test APIs.

Features:

Specification Languages: Supports RAML and OAS (OpenAPI Specification) for defining APIs.

Interactive Editing: Provides a graphical and text-based interface to design API specifications interactively.

Mocking Service: Allows developers to create mock services to simulate API behavior before the actual implementation.

Process:

Define API: Use API Designer to create a detailed API specification, including endpoints, methods, request/response schemas, and security schemes.

Documentation: Automatically generate API documentation that can be shared with stakeholders.

Testing: Test the API design using the built-in mocking service to ensure it meets requirements.

問題 #26

A Kubernetes controller automatically adds another pod replica to the resource pool in response to increased application load. Which scalability option is the controller implementing?

- A. Down
- B. Vertical
- C. Diagonal
- **D. Horizontal**

答案： D

解題說明：

Kubernetes offers several scalability options to handle varying application loads. The scenario described involves adding another pod replica in response to increased load, which is a form of horizontal scaling. Here's a detailed explanation:

Horizontal Scaling:

Definition: Horizontal scaling, also known as scaling out, involves adding more instances (pods) to distribute the load and increase capacity.

Implementation in Kubernetes: Kubernetes uses controllers like the Horizontal Pod Autoscaler (HPA) to automatically adjust the number of pod replicas based on observed CPU utilization or other select metrics.

Benefits:

Load Distribution: By adding more pod replicas, the load is evenly distributed, reducing the risk of any single pod being overwhelmed.

Fault Tolerance: Horizontal scaling enhances fault tolerance and availability, as multiple pod replicas can handle requests if one fails.

Automatic Scaling:

Kubernetes Controller: The HPA continuously monitors the application load and adjusts the number of pod replicas accordingly, ensuring optimal performance.

問題 #27

According to MuleSoft a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system is an example of which system integration interaction pattern?

- A. Multicast
- B. One-way
- C. Request-Reply
- D. Batch

答案: C

解題說明:

In system integration, different interaction patterns are used depending on the communication requirements between systems. For a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system, the Request-Reply pattern is used. Here's a detailed explanation:

Request-Reply Pattern:

Definition: This pattern involves a client sending a request to a server and waiting for a reply. The communication is synchronous, meaning the client waits for the server to process the request and send back the response.

Typical Use Case: It is used when immediate feedback is required from the server, such as retrieving a specific customer record.

RESTful API and HTTP:

Synchronous Communication: HTTP is inherently synchronous, making it suitable for Request-Reply interactions where the client expects an immediate response.

Data Retrieval: Commonly used for GET requests in RESTful APIs to retrieve data from a server.

Example:

Scenario: A client application requests customer details by making a GET request to a RESTful API endpoint. The server processes the request and returns the customer record.

問題 #28

An integration team follows MuleSoft's recommended approach to full lifecycle API development. Which activity should this team perform during the API implementation phase?

- A. Use the API specification to monitor the MuleSoft application
- B. Design the API specification
- C. Validate the API specification
- D. Use the API specification to build the MuleSoft application

答案: D

解題說明:

MuleSoft recommends a full lifecycle API development approach which includes several phases such as design, implementation, testing, deployment, and management. During the API implementation phase, the primary activity is to use the API specification to build the MuleSoft application. Here's a detailed explanation:

API Design:

Create API Specification: Initially, an API specification is created using RAML or OAS (OpenAPI Specification) to define the API's structure, endpoints, request/response formats, and security requirements.

API Implementation:

Build Mule Application: Using the API specification as a blueprint, the development team implements the MuleSoft application. This involves creating flows, integrating with backend systems, and ensuring the API functions as specified.

APIKit: MuleSoft provides APIKit, a tool that automatically generates Mule flows based on the API specification, speeding up the development process.

Testing: During implementation, unit tests (using MUnit) and integration tests are created to ensure the API behaves as expected.

Validation and Monitoring:

Validate Against Specification: Throughout the implementation phase, the API is continuously validated against the original specification to ensure compliance.

Deployment and Monitoring: Post-implementation, the API is deployed, and tools like Anypoint Monitoring are used to monitor its performance and usage.

問題 #29

Which component of Anypoint Platform belongs to the platform control plane?"

- A. Anypoint Connectors
- B. Runtime Replica
- **C. API Manager**
- D. Runtime Fabric

答案：C

解題說明：

In Anypoint Platform, the control plane is responsible for managing and controlling the various components and services that make up the platform. API Manager is part of the control plane, providing centralized management of APIs. Here's a detailed explanation: Control Plane:

Definition: The control plane in Anypoint Platform is responsible for the management, monitoring, and control of APIs, applications, and other platform resources.

Components: Includes tools for API management, analytics, security, and governance.

API Manager:

Purpose: Allows users to manage API policies, monitor API usage, and secure APIs. It provides a centralized interface for managing the entire lifecycle of APIs.

Features:

Policy Enforcement: Apply security policies, rate limiting, and other governance rules.

Analytics and Monitoring: Track API performance, usage statistics, and detect anomalies.

Access Control: Manage user access and permissions for APIs.

MuleSoft Documentation: API Manager
