In order to save you a lot of installation troubles, we have carried out the online engine of the COF-C02 latest exam guide which does not need to download and install. This kind of learning method is convenient and suitable for quick pace of life. But you must have a browser on your device. Our online workers are going through professional training. Your demands and thought can be clearly understood by them. Even if you have bought our high-pass-rate COF-C02 training practice but you do not know how to install it, we can offer remote guidance to assist you finish installation. In the process of using, you still have access to our after sales service. All in all, we will keep helping you until you have passed the COF-C02 exam and got the certificate.

Snowflake SnowPro Core Certification Exam Sample Questions (Q1046-

Q1051):

NEW QUESTION # 1046

User-level network policies can be created by which of the following roles? (Select TWO).

- A. ROLEADMIN
- B. USERADMIN
- C. SECURITYADMIN
- D. ACCOUNTADMIN
- E. SYSADMIN

Answer: B,C

NEW QUESTION # 1047

What does Snowflake recommend for a user assigned the ACCOUNTADMIN role?

- A. The ACCCUKTMKIN role should be set as the user's default role.
- B. The user should be required to use Multi-Factor Authentication (MFA).
- C. The user should use federated authentication instead of a password
- D. There should be just one user with the ACCOUNTADMIN role in each Snowflake account.

Answer: B

Explanation:

For users assigned the ACCOUNTADMIN role, Snowflake recommends enforcing Multi-Factor Authentication (MFA) to enhance security. The ACCOUNTADMIN role has extensive permissions, making it crucial to secure accounts held by such users against unauthorized access. MFA adds an additional layer of security by requiring a second form of verification beyond just the username and password, significantly reducing the risk of account compromise.

NEW QUESTION # 1048

Which command is used to take away staged files from a Snowflake stage after a successful data ingestion?

- A. DROP
- B. DELETE
- C. TRUNCATE
- D. REMOVE

Answer: D

Explanation:

The REMOVE command is used in Snowflake to delete files from a stage after they have been successfully ingested into Snowflake tables. This command helps manage storage by allowing users to clean up staged files that are no longer needed, ensuring that the stage does not accumulate unnecessary data over time.

Unlike DELETE, DROP, or TRUNCATE commands, which are used for managing data within Snowflake tables or dropping objects, REMOVE specifically targets the management of files in stages. References:

NEW QUESTION # 1049

Which Snowsight feature can be used to perform data manipulations and transformations using a programming language?

- A. Provider Studio
- B. SnowSQL
- C. Dashboards
- D. Python worksheets

Answer: D

Explanation:

Python worksheets in Snowsight enable users to perform data manipulations and transformations using the Python programming language directly within the Snowflake environment. This feature integrates the power of Python with Snowflake's data warehousing capabilities, allowing for sophisticated data analysis and manipulation.

* Introduction to Python Worksheets:

* Python worksheets provide an interactive environment to write and execute Python code.

* They are designed to facilitate data science and data engineering tasks.

* Functionality:

* Users can run Python scripts to manipulate data stored in Snowflake.

* It allows for leveraging Python's extensive libraries for data analysis, machine learning, and more.

* Integration with Snowflake:

* Python worksheets run on Snowflake's compute infrastructure, ensuring scalability and performance.

* They can access and manipulate Snowflake tables directly, making them a powerful tool for data transformation.

NEW QUESTION # 1050

What does a Query Profile metric that shows excessive spillage indicate?

- A. Expired temporary tables
- B. Improper Common Table Expressions (CTEs)
- C. Poor query optimization
- D. Improper virtual warehouse sizing

Answer: D

Explanation:

* Excessive spillage in the Query Profile indicates that intermediate query results are being written to remote storage (disk) instead of being processed in memory. This usually happens when:

* The virtual warehouse does not have sufficient resources (e.g., memory, compute power).

* Large datasets or complex operations (e.g., joins, aggregations) require more memory than available.

Solution:

* Increase the size of the virtual warehouse to provide more compute and memory resources.

Why Other Options Are Incorrect:

* A. Poor query optimization: This could contribute, but spillage is primarily tied to resource constraints.

* B. Expired temporary tables: Temporary tables have no relation to spillage.

* D. Improper CTEs: The use of CTEs does not directly cause spillage.

References:

* Query Profile and Performance

NEW QUESTION # 1051
