Of course, the combination use of different version of the Drupal-Site-Builder Test Guide is also a good choice. You can purchase according to your own tastes.

Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 Sample Questions (Q42-Q47):

NEW QUESTION # 42

Your Marketing Department notified you that the company has recently obtained a new Toll-free phone number for customer care. They have asked you to update the "Customer care contact information" posted on your website with the new number. The contact information appears in the sidebar of every page on the site.

How should you make your updates? (Select 2 options)

- A. Click the "Edit" link on any page and make changes to the content in the editor form; repeat this process for all pages on the site.
- B. Navigate to the Block Layout admin page's custom block library, find the custom block that contains the information in question, and make changes to the content in the block editor.

- C. Click the "Manage layout" link of the home page, find the field containing the inaccurate information, and make changes there.
- D. Hover over the content until a pencil icon appears, click the icon, and choose "Edit" so that you can modify the content in Custom block edit interface.

Answer: B,D

Explanation:

In Drupal 10 and Drupal 11, content that appears in the sidebar across all pages is typically implemented as a custom block placed in a theme region via the Block Layout system. Drupal documentation explains that reusable content like contact information is best managed through custom blocks, which can be edited centrally and automatically update everywhere they are placed.

Option A is correct because the proper way to update such content is to go to Structure # Block layout # Custom block library, locate the block, and edit it. This ensures the change is reflected globally wherever the block is used.

Option C is also correct because Drupal provides contextual links (the pencil icon) that allow administrators to directly edit blocks from the front end. This is a standard and documented shortcut for editing block content.

Option B is incorrect because Layout Builder is not mentioned and is not required here. Option D is incorrect because editing individual pages would not update a shared sidebar block and would be inefficient and incorrect.

Thus, the correct Drupal site-building approaches are editing the custom block via the block library or using contextual links, making A and C correct.

NEW QUESTION # 43

You have enabled website feedback contact form to allow users to submit feedback. You would like to redirect users to a different page after submission.

How will you accomplish this?

- A. Set "Redirect URL" on Site information page under configuration.
- B. Use an add-on module like Webform, since Core doesn't offer this feature.
- C. Allow users to add their own Redirect URL in user profile pages.
- D. Add the desired destination page to the "Redirect path" field in contact form settings.

Answer: D

Explanation:

Drupal core's Contact module allows administrators to configure multiple contact forms, each with its own settings. One of the configurable options is the ability to define a redirect path after form submission. This is done within the specific contact form's configuration, where you can specify the destination page users should be taken to after submitting the form.

Option D is correct because Drupal provides a "Redirect path" setting directly in the contact form configuration, making it possible to send users to a custom page such as a thank-you or confirmation page after submission.

Option A is incorrect because Drupal core already supports this functionality without needing a contributed module like Webform.

Option B is incorrect because Site information settings do not control form submission redirects. Option C is not relevant, as redirect behavior is not controlled through user profiles.

Thus, the correct Drupal-native solution is to configure the redirect path within the contact form settings, making D the correct answer.

NEW QUESTION # 44

You have installed a custom theme for your website, and you notice that the theme displays a Drupal icon as the favicon in the browser. As much as you love Drupal, you would like to remove this favicon and display your company's favicon instead.

How would you do this in the Drupal admin interface?

- A. Go to Configuration > Basic Site Settings and upload your new favicon.
- B. Use a contributed module to inject CSS to hide the Drupal icon and display your logo instead.
- C. Go to Appearance > Settings and upload your new favicon.
- D. Place the Site branding block in the appropriate region and enable the favicon under "Toggle branding elements".

Answer: C

Explanation:

In Drupal 10 and Drupal 11, favicon settings are managed at the theme level, not through general site configuration. The official Drupal theming documentation explains that each theme has its own configurable settings, including the ability to upload or replace

the site's favicon.

To change the favicon, you navigate to Appearance # Settings (or specifically the active theme's settings page), where you will find an option to upload a custom favicon or use the default. This allows you to replace the default Drupal icon (Druplicon) with your organization's icon.

Option A is incorrect because the Site branding block controls elements like the logo and site name, not the favicon. Option C is incorrect because Basic Site Settings does not manage favicon configuration in modern Drupal versions. Option D is unnecessary and incorrect, as CSS is not used to change favicons.

Therefore, the correct and documented method is to update the favicon through the theme settings in the Appearance section, making option B correct.

NEW QUESTION # 45

Your website has a content type named Hotel with a Taxonomy reference field for Landmarks vocabulary.

You want to create a view to list all the hotels filtered by landmarks as a contextual filter.

How will you pass the term name in the URL for the contextual filter?

- A. Add Landmarks vocabulary as a contextual filter and pass term name as a contextual filter.
- B. Add Landmarks vocabulary as a relationship and then add Landmarks vocabulary as a contextual filter.
- C. Add Landmarks vocabulary as an exposed filter pass term name as the filter value.
- D. Add Landmarks vocabulary both as an exposed filter and contextual filter.

Answer: A

Explanation:

In Drupal 10 and Drupal 11, Views contextual filters are used to dynamically filter content based on values passed through the URL. When filtering content by taxonomy (such as Landmarks), you configure a contextual filter using the taxonomy term field associated with the content type.

To pass a value like a term name in the URL, you must configure the contextual filter to accept term identifiers such as term ID or term name. Drupal Views allows validation and transformation of contextual input, including using the taxonomy term name via settings like "Provide default value" or "Specify validation criteria." This matches option B.

Option A is incorrect because exposed filters rely on user input via UI forms, not URL path arguments.

Option C is unnecessary duplication and not aligned with best practices. Option D is not required because taxonomy reference fields already provide the necessary relationship internally for filtering; explicitly adding a relationship is only needed in more complex multi-entity scenarios.

Therefore, the correct approach is to use a contextual filter configured to accept the taxonomy term (including term name) via the URL, making option B correct.

NEW QUESTION # 46

You manage a local restaurants guide website. You are creating a page listing all the restaurants registered on your site. You've been asked to make sure that each restaurant in the list includes an image, a title, and cuisine style. When the user clicks the title or picture, the user will be taken to a detail page showing a full description of the restaurant.

Which 2 options will ensure that the listing page only contains the fields noted, without removing the description field from the detail page?

- A. Create a second content type called "Restaurant Overview," which only contains the image, title, and cuisine fields. Use the Views module to create a list of all of these Restaurant Overview nodes, but link their titles to their corresponding Restaurant nodes.
- B. Use the Views module to create a list of all restaurants. Configure the view to hide the description field by adding a custom CSS class to its wrapper.
- C. Use the Views module to create a list of all restaurants, and make sure it displays each restaurant row as fields. Add the image, title, and cuisine fields to the view's field list.
- D. Use custom display settings for the "Teaser" view mode and configure it to display only the image, title, and cuisine fields. Use the Views module to create a list of all restaurants, displaying each row as content using the "Teaser" view mode.

Answer: C,D

Explanation:

Drupal 10 and Drupal 11 provide multiple ways to control how content is displayed without altering the underlying data. The requirement here is to show only selected fields (image, title, cuisine) in a listing, while keeping the full description available on the detail page.

Option A is correct because Views allows you to display content as fields , meaning you can explicitly choose which fields to show. This is a core feature of the Views module and is commonly used for listing pages.

Option C is also correct because Drupal supports view modes (like Teaser and Full). The documentation explains that you can configure the Teaser view mode to show only selected fields. Then, in Views, you can display content using that view mode. This approach is reusable and aligns with Drupal's display system.

Option B is incorrect because creating a duplicate content type is unnecessary and violates content modeling best practices. Option D is incorrect because hiding fields with CSS does not remove them from the rendered output and is not a proper Drupal solution. Thus, using Views fields or Teaser view mode are the correct, documented approaches.

NEW QUESTION # 47

.....

First of all, you are able to make full use of our Drupal-Site-Builder study torrent through three different versions: PDF, PC and APP online version of our Drupal-Site-Builder training guide. For each version, there is no limit and access permission if you want to download our study materials, and at the same time the number of people is not limited. After you purchase Drupal-Site-Builder Study Materials, we guarantee that your Drupal-Site-Builder study material is tailor-made. The last but not least, we can provide you with a free trial service on the Drupal-Site-Builder exam questions.

Latest Drupal-Site-Builder Test Testking: <https://www.dumpstorrent.com/Drupal-Site-Builder-exam-dumps-torrent.html>

They always hesitate if they should register for Acquia Drupal-Site-Builder examinations and if exam cram pdf is valid since the test exam cost is high, they may waste money if they fail the exam. And our software of the Drupal-Site-Builder training material also allows different users to study at the same time, The Drupal-Site-Builder test is not an easy exam to crack, Quickly use our Drupal-Site-Builder study materials.

Collecting every event and every column on a busy server Drupal-Site-Builder is impractical because the resulting trace would grow rapidly to unmanageable size and be difficult to decipher.

How the file can be used, and for what, often Reliable Drupal-Site-Builder Exam Labs depends on file format, They always hesitate if they should register for Acquia Drupal-Site-Builder examinations and if exam cram pdf is valid since the test exam cost is high, they may waste money if they fail the exam.

The Benefits of Preparing with the Acquia Drupal-Site-Builder Practice Test

And our software of the Drupal-Site-Builder training material also allows different users to study at the same time, The Drupal-Site-Builder test is not an easy exam to crack, Quickly use our Drupal-Site-Builder study materials.
