## NSE8\_812 Practice Test Pdf, NSE8\_812 Reliable Exam Registration

The TroytecDumps offers valid, updated, and real Fortinet NSE 8 - Written Exam (NSE8\_812) NSE8\_812 exam practice questions that perfectly and quickly prepare the NSE8\_812 exam candidates. You can easily pass the challenging Fortinet NSE 8 - Written Exam (NSE8\_812) NSE8\_812 Certification Exam. NSE8\_812 exam practice test questions you will get everything that you need to learn, prepare and pass the valuable NSE8\_812 certification with good scores.

Fortinet NSE8\_812 certification exam is designed to test the knowledge and skills required to manage and administer complex network security solutions using Fortinet products. NSE8\_812 exam is part of the Fortinet Network Security Expert (NSE) program and is one of the most advanced certifications offered by Fortinet. The NSE8\_812 Exam covers a wide range of topics, including FortiGate advanced security features, FortiManager and FortiAnalyzer, advanced IPsec VPN, and advanced threat protection.

## Fortinet NSE 8 - Written Exam (NSE8\_812) Sample Questions (Q93-Q98):

### NEW QUESTION # 93

Refer to the exhibits.

A FortiGate cluster (CL-1) protects a data center hosting multiple web applications. A pair of FortiADC devices are already configured for SSL decryption (FAD-1), and re-encryption (FAD-2). CL-1 must accept unencrypted traffic from FAD-1, perform application detection on the plain-text traffic, and forward the inspected traffic to FAD-2.

The SSL-Offload-App-Detect application list and SSL-Offload protocol options profile are applied to the firewall policy handling the web application traffic on CL-1.

Given this scenario, which two configuration tasks must the administrator perform on CL-1? (Choose two.) A)

B)

☐

- A. Option C
- B. Option B
- C. Option A
- D. Option D

**Answer: A,B**

Explanation:

To enable application detection on plain-text traffic that has been decrypted by FortiADC, the administrator must perform two configuration tasks on CL-1:

Enable SSL offloading in the firewall policy and select the SSL-Offload protocol options profile.

Enable application control in the firewall policy and select the SSL-Offload-App-Detect application list. References:

<https://docs.fortinet.com/document/fortigate/6.4.0/cookbook/103438/application-detection-on-ssl-offloaded-traffic>

#### NEW QUESTION # 94

Refer to the exhibits.

☐ A FortiGate cluster (CL-1) protects a data center hosting multiple web applications. A pair of FortiADC devices are already configured for SSL decryption (FAD-1), and re-encryption (FAD-2). CL-1 must accept unencrypted traffic from FAD-1, perform application detection on the plain-text traffic, and forward the inspected traffic to FAD-2.

The SSL-Offload-App-Detect application list and SSL-Offload protocol options profile are applied to the firewall policy handling the web application traffic on CL-1.

Given this scenario, which two configuration tasks must the administrator perform on CL-1? (Choose two.) A)

☐ B)

☐

- A. Option C
- B. Option B
- C. Option A
- D. Option D

**Answer: A,B**

Explanation:

To enable application detection on plain-text traffic that has been decrypted by FortiADC, the administrator must perform two configuration tasks on CL-1:

Enable SSL offloading in the firewall policy and select the SSL-Offload protocol options profile.

Enable application control in the firewall policy and select the SSL-Offload-App-Detect application list. Reference:

<https://docs.fortinet.com/document/fortigate/6.4.0/cookbook/103438/application-detection-on-ssl-offloaded-traffic>

#### NEW QUESTION # 95

Refer to the exhibit, which shows an SD-WAN configuration.

☐ You configured the SD-WAN from Branch1 to the HUB and enabled packet duplication. You later notice that the traffic is not being duplicated. In this scenario, what is causing this problem?

- A. Packet duplication is not enabled on the HUB side.
- B. Traffic cannot be duplicated over multiple zones.
- C. There is a mismatch in the FortiOS version between Branch1 and HUB.
- D. Packet duplication did not occur because an interface is out of SLA.

**Answer: B**

#### NEW QUESTION # 96

Refer to the exhibit containing the configuration snippets from the FortiGate. Customer requirements:

☐ \* SSLVPN Portal must be accessible on standard HTTPS port (TCP/443)

\* Public IP address (129.11.1.100) is assigned to port1

\* Datacenter.acmecorp.com resolves to the public IP address assigned to port1 The customer has a Let's Encrypt certificate that is

going to expire soon and it reports that subsequent attempts to renew that certificate are failing.  
Reviewing the requirement and the exhibit, which configuration change below will resolve this issue?

- A)
- B)
- C)
- D)

- A. Option C
- **B. Option B**
- C. Option A
- D. Option D

**Answer: B**

Explanation:

The customer's SSLVPN Portal is currently configured to use a self-signed certificate. This means that the certificate is not trusted by any browsers, and users will have to accept a security warning before they can connect to the portal.

To resolve this issue, the customer needs to configure the FortiGate to use a Let's Encrypt certificate. Let's Encrypt is a free certificate authority that provides trusted certificates for websites and other applications.

The configuration change in option B will configure the FortiGate to use a Let's Encrypt certificate for the SSLVPN Portal. This will allow users to connect to the portal without having to accept a security warning.

The other configuration changes are not necessary to resolve the issue. Option A will configure the FortiGate to use a different port for the SSLVPN Portal, but this will not resolve the issue with the self-signed certificate. Option C will configure the FortiGate to use a different DNS name for the SSLVPN Portal, but this will also not resolve the issue with the self-signed certificate. Option D will configure the FortiGate to use a different certificate authority for the SSLVPN Portal, but this will also not resolve the issue because the customer still needs to use a trusted certificate.

#### NEW QUESTION # 97

Review the following FortiGate-6000 configuration excerpt:

Based on the configuration, which statement is correct regarding SNAT source port partitioning behavior?

- A. It dynamically distributes SNAT source ports to operating FPCs or FPMs.
- B. It is the default SNAT configuration and preserves active sessions when an FPC or FPM goes down.
- C. It equally distributes SNAT source ports across chassis slots.
- **D. It statically distributes SNAT source ports to operating FPCs or FPMs**

**Answer: D**

Explanation:

<https://docs.fortinet.com/document/fortigate/7.4.1/fortigate-6000-administration-guide/81276/controlling-snat-port-partitioning-behavior>

"chassis-slots this option statically allocates SNAT source ports to all FPCs that are enabled when you enter the command. If you disable an FPC from the CLI, the SNAT source ports assigned to that FPC will not be re-allocated to the remaining FPCs. All FPCs that are still operating will maintain the same SNAT source port allocation and active sessions being processed by the still operating FPCs will not be affected."
