Huawei HCSP-Presales-Campus Network Planning and Design V2.0 Sample Questions (Q10-Q15):

NEW QUESTION # 10

Which protocol is used to automatically advertise VN routes between sites?

- A. OSPF
- B. RIP
- C. BGP EVPN
- D. Static routing

Answer: C

Explanation:

BGP EVPN (Border Gateway Protocol Ethernet Virtual Private Network) is the standard control plane protocol used in Huawei's SD-WAN and Fabric solutions. It acts as the "messenger" that automatically advertises Virtual Network (VN) routes, MAC addresses, and tunnel encapsulation information between sites. This replaces the need for complex static routing or legacy protocols like RIP/OSPF for overlay communication, enabling massive scalability and automation.

NEW QUESTION # 11

Which of the following are the advantages of SDN?

- A. Network virtualization
- B. Network automation
- C. Rapid service provisioning
- D. Open programmability

Answer: A,B,C,D

Explanation:

The Huawei Xinghe Intelligent Campus leverages SDN to deliver four core benefits:

* Open Programmability (A): Via Northbound APIs for integration with 3rd-party apps.

* Network Automation (B): Automating full-lifecycle O & M.

* Rapid Service Provisioning (C): Reducing deployment time from weeks to minutes via templates.

* Network Virtualization (D): Using VXLAN/EVPN to create multiple isolated logical networks (e.g., IoT, Office, Security) on a single physical infrastructure.

NEW QUESTION # 12

Switches can be stacked to improve reliability.

- A. False
- B. True

Answer: B

Explanation:

Stacking (iStack) is a key reliability technology for the access and aggregation layers. By connecting multiple switches into a single logical unit, the network gains device-level redundancy. If one switch in the stack fails, the other member switches continue to forward traffic. Furthermore, it allows for the use of Inter-device Eth-Trunk (link aggregation across different physical switches), which prevents loops without the need for STP, leading to faster convergence and higher network availability.

NEW QUESTION # 13

Hybrid cables do not support PoE++ power supply.

- A. True
- B. False

Answer: B

Explanation:

This statement is False . Huawei's Hybrid Optical-Electrical Cables (Photoelectric cables) are specifically designed to overcome the 100-meter distance limitation of traditional Ethernet. They combine optical fibers for high-speed data (10G/25G/100G) and copper wires for power. These cables are a core part of the "Simplified Architecture" and do support PoE++ (up to 90W), allowing high-power Wi-Fi 7 APs to be powered over distances of up to 300-500 meters from a central switch.

NEW QUESTION # 14

Which of the following statements are true about the wireless traffic forwarding modes on a fabric wireless network?

- A. Direct forwarding is more efficient.
- B. Tunnel forwarding facilitates centralized management and control of wireless traffic.
- C. Direct forwarding is not suitable for scenarios that have high requirements on roaming performance. This is because roaming performance deteriorates slightly when a STA roams across edges.
- D. Tunnel forwarding has the disadvantage of traffic detour, which increases the forwarding performance pressure on the WAC.

Answer: A,B,C,D

Explanation:

Huawei supports two main forwarding modes in its wireless architecture:

* Tunnel Forwarding (A, C): All data traffic is encapsulated in CAPWAP and sent to the WAC. This simplifies security policy enforcement but causes "traffic detour" and places a heavy processing load on the WAC.

* Direct Forwarding (B, D): APs switch traffic locally. This is highly efficient and reduces core congestion. However, because traffic is released at the edge, maintaining session continuity (roaming) across different Layer 3 boundaries can be more complex, potentially leading to slight performance dips during inter-edge handovers compared to centralized tunneling.
