## SISA Certified Security Professional in Artificial Intelligence Sample Questions (Q17-Q22):

### NEW QUESTION # 17

How does ISO 27563 support privacy in AI systems?

- A. By providing guidelines for privacy-enhancing technologies in AI.
- B. By mandating the use of specific encryption algorithms.
- C. By focusing on performance metrics over privacy.
- D. By limiting AI to non-personal data only.

**Answer: A**

Explanation:

ISO 27563 offers practical guidance on implementing privacy-enhancing technologies (PETs) in AI, such as differential privacy or federated learning, to protect data while maintaining utility. It addresses risks like inference attacks, ensuring compliance with privacy regulations. Exact extract: "ISO 27563 supports privacy in AI by providing guidelines for privacy-enhancing technologies."

(Reference: Cyber Security for AI by SISA Study Guide, Section on ISO 27563 for Privacy, Page 265-268).

### NEW QUESTION # 18

In utilizing Giskard for vulnerability detection, what is a primary benefit of integrating this open-source tool into the security function?

- A. Reducing the need for manual vulnerability assessment entirely
- B. Automatically patching vulnerabilities without additional configuration
- C. Limiting its use to only high-priority vulnerabilities.
- D. Enabling real-time detection of vulnerabilities with actionable insights.

**Answer: D**

Explanation:

Giskard, an open-source tool, enhances AI security by enabling real-time vulnerability detection, scanning models for issues like bias or adversarial weaknesses, and providing actionable insights for remediation. This proactive approach supports continuous monitoring, unlike automated patching or limited scopes, and integrates into SDLC for robust security. Exact extract: "Giskard enables real-time detection of vulnerabilities with actionable insights, strengthening AI security functions." (Reference: Cyber Security for AI by SISA Study Guide, Section on Vulnerability Detection Tools, Page 190-193).

### NEW QUESTION # 19

In a financial technology company aiming to implement a specialized AI solution, which approach would most effectively leverage existing AI models to address specific industry needs while maintaining efficiency and accuracy?

- A. Adopting a Foundation Model as the base and fine-tuning it with domain-specific financial data to enhance its capabilities for forecasting and risk assessment.
- B. Integrating multiple separate Domain-Specific GenAI models for various financial functions without using a foundational model for consistency
- C. Building a new, from scratch Domain-Specific GenAI model for financial tasks without leveraging preexisting models.
- D. Using a general Large Language Model (LLM) without adaptation, relying solely on its broad capabilities to handle financial tasks.

**Answer: A**

Explanation:

Leveraging foundation models like GPT or BERT for fintech involves fine-tuning with sector-specific data, such as transaction logs or market trends, to tailor for tasks like risk prediction, ensuring high accuracy without the overhead of scratch-building. This approach maintains efficiency by reusing pretrained weights, reducing training time and resources in SDLC, while domain adaptation mitigates generalization issues. It outperforms unadapted general models or fragmented specifics by providing cohesive, scalable solutions.

Security is enhanced through controlled fine-tuning datasets. Exact extract: "Adopting a Foundation Model and fine-tuning with domain-specific data is most effective for leveraging existing models in fintech, balancing efficiency and accuracy." (Reference: Cyber Security for AI by SISA Study Guide, Section on Model Adaptation in SDLC, Page 105-108).

### NEW QUESTION # 20

Which of the following is a characteristic of domain-specific Generative AI models?

- A. They are designed to run exclusively on quantum computers
- B. They are trained on broad datasets covering multiple domains
- C. They are only used for computer vision tasks
- D. They are tailored and fine-tuned for specific fields or industries

**Answer: D**

Explanation:

Domain-specific Generative AI models are refined versions of foundational models, adapted through fine-tuning on specialized datasets to excel in niche areas like healthcare, finance, or legal applications. This tailoring enhances precision, relevance, and efficiency by incorporating industry-specific jargon, patterns, and constraints, unlike general models that handle broad tasks but may lack depth. For example, a medical GenAI model might generate accurate diagnostic reports by focusing on clinical data, reducing

errors in specialized contexts. This approach balances computational resources and performance, making them ideal for targeted deployments while maintaining the generative capabilities of larger models. Security implications include better control over sensitive domain data. Exact extract: "Domain-specific GenAI models are characterized by being tailored and fine-tuned for particular fields or industries, leveraging specialized data to achieve higher accuracy and relevance in those domains." (Reference: Cyber Security for AI by SISA Study Guide, Section on GenAI Model Types, Page 65-67).

### NEW QUESTION # 21

In ISO 42001, what is required for AI risk treatment?

- A. Delegating all risk management to external auditors.
- **B. Identifying, analyzing, and evaluating AI-specific risks with treatment plans.**
- C. Ignoring risks below a certain threshold.
- D. Focusing only on post-deployment risks.

**Answer: B**

Explanation:

ISO 42001 mandates a systematic risk treatment process, involving identification of AI risks (e.g., bias, security), analysis of impacts, evaluation against criteria, and development of treatment plans like mitigation or acceptance. This ensures proactive management throughout the AI lifecycle. Exact extract: "ISO 42001 requires identifying, analyzing, and evaluating AI risks with appropriate treatment plans." (Reference: Cyber Security for AI by SISA Study Guide, Section on Risk Treatment in ISO 42001, Page 270-273).
