## WGU Cloud Deployment and Operations Sample Questions (Q63-Q68):

### NEW QUESTION # 63

(Which two solutions are supported by CloudWatch? Choose 2 answers.)

- A. Load balancing
- B. Event response
- C. Instance monitoring
- D. Threat detection

**Answer: B,C**

Explanation:

Amazon CloudWatch supports several monitoring and management solutions, including event response and instance monitoring. Event response is facilitated through CloudWatch Events, which can trigger actions based on predefined rules, such as invoking AWS Lambda functions. Instance monitoring involves collecting and tracking metrics from Amazon EC2 instances, providing visibility into performance and health. The WGU Cloud Deployment and Operations Study Guide (Section 4.1, CloudWatch Overview) highlights that CloudWatch is designed for instance monitoring and event-driven responses, while load balancing and threat detection are handled by services like Elastic Load Balancing and GuardDuty, respectively.

### NEW QUESTION # 64

(An administrator needs to deploy a NAT gateway in an existing VPC subnet. Which two tasks should this administrator perform during deployment? Choose 2 answers.)

- A. Configure the route table associated with the subnet
- B. Configure the access control list associated with the subnet
- C. Assign a private IP address to the NAT gateway
- D. Assign an elastic IP address to the NAT gateway

**Answer: A,D**

Explanation:

To deploy a NAT gateway in an existing VPC subnet, the administrator must assign an elastic IP address to the NAT gateway for public internet access and configure the route table associated with the subnet to route traffic through the NAT gateway. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, NAT Gateway) states, "Deployment of a NAT gateway requires an elastic IP address for outbound internet connectivity and a route table update to direct private subnet traffic to the NAT gateway (e.g., 0.0.0.0/0 via NAT)." Private IP assignment and ACL configuration are not required steps.

### NEW QUESTION # 65

(What is used to change stacks across multiple accounts and Regions in a single operation?)

- A. Stack policies
- B. Nested stacks
- C. StackSets
- D. StackInstance

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

StackSets are used to change stacks across multiple AWS accounts and regions in a single operation, enabling centralized management of infrastructure deployments. StackSets allow administrators to create, update, or delete stacks consistently across specified accounts and regions. The WGU Cloud Deployment and Operations Study Guide (Section 5.4, StackSets) states, "StackSets provide the capability to manage and update stacks across multiple accounts and regions with a single operation,

streamlining multi-region deployments." StackInstance, nested stacks, and stack policies do not support this multi-account, multi-region functionality.

#### NEW QUESTION # 66

(What should be configured in Systems Manager to set the error threshold for automation documents?)

- **A. Rate control**
- B. Resource group
- C. Session preferences
- D. Maintenance windows

**Answer: A**

Explanation:

In AWS Systems Manager, the error threshold for automation documents is configured using rate control.

Rate control allows administrators to define the maximum number of errors or concurrent executions that can occur before an automation task is throttled or stopped, ensuring system stability. The WGU Cloud Deployment and Operations Study Guide (Section 5.1, Systems Manager Automation) explicitly states, "Rate control settings in Automation documents can be used to specify the maximum number of errors allowed during execution, helping to manage error thresholds effectively." Resource groups, session preferences, and maintenance windows do not directly address error thresholds.

#### NEW QUESTION # 67

(Media files are stored in an S3 bucket in region A. Demand for the files from region B has increased. Region B is suffering from some latency issues due to geographical location. Which type of replication will reduce the latency in region B?)

- A. S3 Versioning
- B. S3 Batch
- C. Same-Region
- **D. Cross-Region**

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To reduce latency in region B due to increased demand for media files stored in region A, cross-region replication (CRR) should be used. CRR replicates objects to an S3 bucket in another region (e.g., region B), allowing users to access files from a closer location, thus minimizing latency. The WGU Cloud Deployment and Operations Study Guide (Section 2.2, S3 Replication) states, "Cross-Region Replication in S3 copies objects to a destination bucket in a different region, reducing latency by enabling access to data from the nearest region, such as region B in this case." S3 Batch, S3 Versioning, and Same-Region replication do not address cross-region latency.
