EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q37-Q42):

NEW QUESTION # 37

Question:

In continuous data protection, what does the amount of journal space determine?

- A. Length of time required to recover the data
- B. Amount of space the source and replica volumes require
- C. How far back the data can be recovered
- D. Amount of data that can be restored to a specific point

Answer: C

Explanation:

In continuous data protection (CDP), journal space stores all the changes made to data over time. The amount of journal space determines the retention window, i.e., how far back in time data can be recovered. A larger journal allows for a longer recovery window.

* Amount of space the source and replica volumes require:Relates to storage capacity, not recovery time.

* Length of time required to recover the data:Depends on system performance and data size.

* Amount of data that can be restored to a specific point:Depends on the changes captured in the journal.

NEW QUESTION # 38

Question:

A company is concerned about unauthorized access to its sensitive data. They want to implement security measures to ensure that only authorized users can access the data. Which goal of information security are they primarily addressing?

- A. Accountability
- B. Availability
- C. Confidentiality
- D. Integrity

Answer: C

Explanation:

Confidentiality ensures that sensitive data is only accessible to authorized users. This is a primary goal of information security, achieved by:

* Access controls(authentication, authorization)

* Encryptionto protect data in transit and at rest

* Monitoring and auditingto detect unauthorized access

* Availability:Ensuring data/services are accessible when needed.

* Accountability:Tracking actions of users (audit trails).

* Integrity:Protecting data from unauthorized modification.

NEW QUESTION # 39

Question:

A company is looking for a backup solution that can reduce its IT management overhead and offer scalability and flexibility. Which type of backup solution would meet these requirements?

- A. Cloud-based backup
- B. Agent-based backup
- C. Image-based backup
- D. Tape-based backup

Answer: A

Explanation:

Cloud-based backup solutions are managed by third-party providers and offer easy scalability, flexibility, and reduced IT management overhead. They allow businesses to focus on operations while the provider manages infrastructure, updates, and capacity.

* Image-based backup: Captures entire system images but may still require local storage and management.

* Agent-based backup: Deploys agents to servers, requiring management of the agents.

* Tape-based backup: Involves hardware and manual processes for storage, increasing management burden.

Reference: Dell Information Storage and Management Foundations 2023 Study Guide, Section: Backup and Cloud Integration.

NEW QUESTION # 40

Question:

A backup array was able to achieve a 30:1 reduction by finding multiple copies of the same data. Which method was used in this scenario?

- A. Data replication
- B. Data encryption
- C. Data deduplication
- D. Data compression

Answer: C

Explanation:

Data deduplication is a technique that eliminates redundant copies of data, storing only unique instances.

When multiple copies of the same data are found, deduplication replaces them with references to a single stored copy, significantly reducing storage requirements.

* Data replication: Involves copying data to another location for redundancy, not reducing storage size.

* Data encryption: Secures data but doesn't affect storage size.

* Data compression: Reduces data size by encoding information more efficiently but doesn't eliminate duplicates.

Reference: Dell Information Storage and Management Foundations 2023 Study Guide, Section: Data Deduplication and Data Archiving Solutions Architecture.

NEW QUESTION # 41

Question:

A company wants to perform a full backup of its critical data. What is the main advantage of this approach?

- A. It requires minimal storage space.
- B. It provides the fastest data recovery.
- C. It is the fastest backup method.
- D. It minimizes the impact on production systems.

Answer: B

Explanation:

A full backup captures all data each time it runs.

* Main advantage: Fastest recovery because no additional backup sets (like incrementals or differentials) need to be combined.

* Disadvantage: Takes more backup time and requires more storage space compared to incremental backups.

* Option B: Full backups have a higher impact because of the time and bandwidth required.

* Option C: Full backups consume the most storage.

* Option D: Full backups are not the fastest in terms of backup window - they are the fastest in recovery.
