And here, fortunately, you have found the SK0-005 exam braindumps, a learning platform that can bring you unexpected experiences.

CompTIA Server+ Certification Exam Sample Questions (Q31-Q36):

NEW QUESTION # 31
An administrator is investigating a physical server that will not boot into the OS. The server has three hard drives configured in a

RAID 5 array. The server passes POST, but the OS does not load. The administrator verifies the CPU and RAM are both seated correctly and checks the dual power supplies. The administrator then verifies all the BIOS settings are correct and connects a bootable USB drive in the server, and the OS loads correctly. Which of the following is causing the issue?

- A. There are multiple failed hard drives.
- B. The page file is too small.
- C. RAID 5 requires four drives
- D. The CPU has failed.
- E. There are mismatched RAM modules.

Answer: A

NEW QUESTION # 32
A server administrator has connected a new server to the network. During testing, the administrator discovers the server is not reachable via server but can be accessed by IP address. Which of the following steps should the server administrator take NEXT? (Select TWO).

- A. Run the tracert command
- B. Run the ping command.
- C. Check the route tables.
- D. Check the hosts file.
- E. Check the DNS server.
- F. Check the default gateway.

Answer: D,E

Explanation:
Explanation
If the server is not reachable by name but can be accessed by IP address, it means that there is a problem with name resolution. The hosts file and the DNS server are both responsible for mapping hostnames to IP addresses. Therefore, the server administrator should check these two files for any errors or inconsistencies that might prevent the server from being resolved by name. References: https://www.howtogeek.com/662249/how-to-edit-the-hosts-file-on-linux/
https://www.howtogeek.com/164981/how-to-use-nslookup-to-check-domain-name-information-in-microsoft-win

NEW QUESTION # 33
An administrator gave Ann modify permissions to a shared folder called DATA, which is located on the company server. Other users need read access to the files in this folder. The current configuration is as follows:
The administrator has determined Ann cannot write anything to the DATA folder using the network. Which of the following would be the best practice to set up Ann's permissions correctly, exposing only the minimum rights required?

- A. Option A
- B. Option B
- C. Option C
- D. Option D

Answer: D

NEW QUESTION # 34
A server has experienced several component failures. To minimize downtime, the server administrator wants to replace the components while the server is running. Which of the following can MOST likely be swapped out while the server is still running? (Select TWO).

- A. The GPU
- B. The RAM
- C. The CPU
- D. The cache
- E. The hard drive

- F. The power supply

Answer: E,F

Explanation:
Explanation
The power supply and the hard drive are two components that can most likely be swapped out while the server is still running, if they support hot swapping or hot plugging. Hot swapping or hot plugging means that the device can be added or removed without shutting down the system. The operating system automatically recognizes the changes that have been made. This feature is useful for minimizing downtime and improving availability. The CPU, the GPU, the cache, and the RAM are not hot swappable and require the system to be powered off before replacing them. References: https://www.geeksforgeeks.org/what-is-hot-swapping/ https://www.howtogeek.com/268249/what-is-hot-swapping-and-what-devices-support-it/

NEW QUESTION # 35

A server technician downloaded new firmware from the manufacturer's website. The technician then attempted to install the firmware on the server, but the installation failed, stating the file is potentially corrupt. Which of the following should the technician have checked prior to installing the firmware?

- A. DLF configuration
- B. MD5 checksum
- C. MBR failure
- D. ECC support

Answer: B

Explanation:
Explanation
A MD5 checksum is a value that is calculated from a file using a cryptographic hash function. A MD5 checksum is used to verify the integrity of a file by comparing it with the original value provided by the manufacturer or the source. If the MD5 checksums match, it means that the file is authentic and has not been corrupted or tampered with. If the MD5 checksums do not match, it means that the file is potentially corrupt or malicious and should not be installed12. A DLF configuration (A) is a setting that determines how a dynamic link library (DLL) is loaded into memory and executed by an application. A DLF configuration does not check the integrity of a file. A MBR failure (B) is a problem that occurs when the master boot record (MBR) of a disk is damaged or corrupted, preventing the system from booting. A MBR failure does not check the integrity of a file. ECC support is a feature that enables error-correcting code (ECC) memory to detect and correct data errors in RAM. ECC support does not check the integrity of a file.
