ISC Certified Information Systems Security Professional (CISSP) Sample

Questions (Q1239-Q1244):

NEW QUESTION # 1239
Which of the following ensures that security is NOT breached when a system crash or other system failure occurs?

- A. Hot swappable
- B. Trusted recovery
- C. Redundancy
- D. Secure boot

Answer: B

Explanation:
Explanation/Reference:
Explanation:
Trusted recovery ensures that security is not breached when a system crash or other system failure (sometimes called a "discontinuity") occurs. It must ensure that the system is restarted without compromising its required protection scheme, and that it can recover and rollback without being compromised after the failure. Trusted recovery is required only for B3 and A1 level systems. A system failure represents a serious security risk because the security controls may be bypassed when the system is not functioning normally.
For example, if a system crashes while sensitive data is being written to a disk (where it would normally be protected by controls), the data may be left unprotected in memory and may be accessible by unauthorized personnel.
Trusted recovery has two primary activities - preparing for a system failure and recovering the system.
Incorrect Answers:
B: Hot swappable refers to computer components that can be swapped while the computer is running. This is not what is described in the question.
C: Redundancy refers to multiple instances of computer or network components to ensure that the system can remain online in the event of a component failure. This is not what is described in the question.
D: Secure Boot refers to a security standard that ensures that a computer boots using only software that is trusted. This is not what is described in the question.

NEW QUESTION # 1240
Which of the following test makes sure the modified or new system includes appropriate access controls and does not introduce any security holes that might compromise other systems?

- A. Interface testing
- B. Recovery testing
- C. Stress/volume testing
- D. Security testing

Answer: D

Explanation:
Security testing makes sure the modified or new system includes appropriate
access controls and does not introduce any security holes that might compromise other systems.
Recovery testing checks the system's ability to recover after a software or hardware failure.
Stress/volume testing involves testing an application with large quantities of data in order to
evaluate performance during peak hours.
Interface testing evaluates the connection of two or more components that pass information from
one area to another.

NEW QUESTION # 1241
In the "Do" phase of the Plan-Do-Check-Act model, which of the following is performed?

- A. Maintain and improve the Business Continuity Management (BCM) system by taking corrective action, based on the results of management review.
- B. Ensure that business continuity policy, objectives, targets, controls, processes and procedures relevant to improving business continuity have been established.
- C. Monitor and review performance against business continuity policy and objectives, report the results to management for review, and determine and authorize actions for remediation and improvement.
- D. Ensure the business continuity policy, controls, processes, and procedures have been implemented.

Answer: B

NEW QUESTION # 1242
Which of the following is a covert channel type?

- A. Memory
- B. Monitoring
- C. Storage
- D. Pipe

Answer: C

Explanation:
The covert channel type that is represented by the option A is storage. A covert channel is a type of communication channel that allows the unauthorized or hidden transfer of information or data between two entities, such as processes, users, or systems, that are not supposed to communicate with each other, and that bypasses the security policies and mechanisms of the system. A storage covert channel is a type of covert channel that uses the shared storage resources, such as memory, disk, or cache, to communicate the information or data, by modifying or reading the storage contents, such as the values, the locations, or the states, of the storage resources. A storage covert channel can compromise the confidentiality and integrity of the information or data, and violate the security principles of the system, such as the least privilege or the separation of duties12. NEW QUESTION # 1243
In addition to providing an audit trail required by auditors, logging can be used to

- A. prevent security violations
- B. identify fields changed on master files.
- C. provide system performance statistics
- D. provide backout and recovery information

Answer: A

Explanation:
Auditing tools are technical controls that track activity within a network on a network device or on a specific computer. Even though auditing is not an activity that will deny an entity access to a network or computer, it will track activities so a network administrator can understand the types of access that took place, identify a security breach, or warn the administrator of suspicious activity. This can be used to point out weakness of their technical controls and help administrators understand where changes need to be made to preserve the necessary security level within the environment. . - Shon Harris All-in-one CISSP Certification Guide pg 179-180
