## Quiz Braindumps & WRT Study Guide

These IICRC WRT updated dumps are launched in the market after suggestions from experienced professionals. Therefore, this IICRC WRT exam study material is kept to the point and concise. The IICRC WRT practice material for Exams. Choice are essential for your successful learning. Often applicants for the exam run on a tight daily schedule before the final IICRC WRT Exam, so actual Water Damage Restoration Technician (WRT) exam questions are fruitful to prepare successfully on the first try.

### IICRC Water Damage Restoration Technician (WRT) Sample Questions (Q70-Q75):

#### NEW QUESTION # 70

What should a restorer do to reduce the aerosolization of contaminants?

- A. Increase temperature
- B. Decrease temperature
- C. Minimize air movement
- D. Increase air movement

**Answer: C**

Explanation:

The IICRC WRT body of knowledge explains that aerosolization of contaminants occurs when airflow disperses particulate matter, microorganisms, or contaminated droplets into the air. To reduce this risk, restorers should minimize air movement in contaminated areas until proper controls are in place.

In Category 2, Category 3, or mold-affected environments, uncontrolled airflow can spread contaminants beyond the affected area, increasing exposure risk and cross-contamination. The WRT manual emphasizes that airflow should be strategically managed and often delayed until containment and air filtration devices (AFDs) are installed.

Increasing air movement or temperature without controls can worsen aerosolization. Temperature reduction alone does not address particulate dispersion. Minimizing air movement-combined with containment and filtration-is the recommended approach under WRT safety principles.

#### NEW QUESTION # 71

SCENARIO: Use the diagram and information below to answer this question.

- . The living room measures 20 feet x 16 feet, with an offset measuring 10 feet x 2 feet.
- . The ceiling height is 8 feet.
- . The entire floor area is wet, and moisture has been detected as high as 21 inches on all walls except Wall A.
- . Water escaped from a broken pipe located behind Wall A. The entire area of wall A is wet.
- . The ceiling is not affected.

Important information:

- . The total square footage of the floor, including the offset, is 340 square feet
- . The total square footage of Wall A after deducting the bottom 2 feet is 120 square feet (USE THE SCENARIO) What is the total number of air movers a restorer should install?

- A. Total of 12
- B. Low Range 8, High Range 11
- C. Low Range 7, High Range 10
- D. Low Range 5, High Range 8

**Answer: C**

Explanation:

Based on IICRC WRT initial air mover placement guidelines:

- \* Floor area: 340 sq ft # typically 1 air mover per 50-70 sq ft
- \* Low range # 5-7
- \* High range # 7-9
- \* Wall drying required:
- \* All walls affected up to 21 inches except Wall A
- \* Wall A fully wet (above 2 ft deduction = 120 sq ft requiring full wall drying)
- \* Offsets and irregular geometry increase airflow demand.

When combining:

- \* Floor drying requirement
- \* Additional air movers for significantly wet walls
- \* One fully saturated wall (Wall A)
- \* One offset area

### NEW QUESTION # 72

Typically, what can cause delamination when carpet is wet?

- A. Excessive tuft bind and shrinkage while drying
- B. Ambient conditions above dew point temperature
- C. Improper application of antimicrobials
- **D. Improper handling and disengaging**

**Answer: D**

Explanation:

The IICRC WRT body of knowledge identifies improper handling and disengaging as a primary cause of carpet delamination during water damage restoration. Delamination occurs when the carpet's primary and secondary backing layers separate, often due to mechanical stress while the carpet is wet and structurally weakened.

When carpet becomes wet, the latex adhesives bonding the backing layers soften and lose strength. If technicians pull, drag, or disengage carpet incorrectly—especially without proper tools such as knee kickers or power stretchers—the weakened backing can separate. The WRT manual emphasizes that wet carpet must be handled carefully and evenly to avoid introducing avoidable secondary damage.

Ambient conditions above dew point, antimicrobial application, or tuft bind strength alone do not typically cause delamination. While shrinkage and tuft bind issues may occur during improper drying, delamination is most often associated with physical mishandling during lifting or removal.

The WRT curriculum stresses that secondary damage caused by improper techniques is the responsibility of the restorer. Proper disengaging methods, correct tools, and controlled handling are essential to preserve restorable carpet systems and reduce liability.

### NEW QUESTION # 73

Who should a technician get documented authorization from before applying an antimicrobial (biocide)?

- A. The primary physician
- B. The primary adjuster
- C. The reconstruction contractor
- **D. The owner or occupant**

**Answer: D**

Explanation:

The IICRC WRT body of knowledge clearly states that before applying an antimicrobial (biocide), a technician must obtain documented authorization from the owner or occupant, or another legally authorized representative of the property. This requirement exists because antimicrobial application involves introducing regulated chemical agents into an occupied environment, which carries potential health, legal, and liability implications.

The WRT manual emphasizes informed consent as a professional and ethical obligation. Owners or occupants must be made aware of the purpose, limitations, and potential risks associated with antimicrobial use.

Documented authorization protects all materially interested parties by confirming that the decision to apply a biocide was disclosed, understood, and approved.

Insurance adjusters do not have authority over health decisions within a structure, reconstruction contractors do not represent occupancy interests, and physicians are not responsible for property treatment approvals. The responsibility lies with the property owner or occupant.

This requirement aligns with EPA pesticide regulations and the ANSI/IICRC S500 Standard, reinforcing transparency, safety, and defensibility in restoration practices.

### NEW QUESTION # 74

Which best describes Category 2 water?

- A. Water that is grossly contaminated and can contain pathogenic, toxigenic, or other harmful agents
- B. Water that originates from a sanitary source and flows into an uncontaminated building
- C. Water that contains significant contamination and has the potential to cause discomfort or sickness if contacted or consumed by humans
- D. Water that originates from a sanitary water source and does not pose substantial risk from ingestion or inhalation exposure

**Answer: C**

Explanation:

The IICRC WRT body of knowledge defines Category 2 water as water that contains significant contamination and has the potential to cause discomfort or illness if contacted or consumed. This classification recognizes that while Category 2 water is not grossly contaminated like Category 3, it is no longer considered clean or sanitary.

Examples commonly cited in the WRT manual include dishwasher or washing machine discharge, toilet overflows with urine but no feces, and seepage due to hydrostatic pressure. These sources may contain microorganisms, nutrients for microbial growth, or other contaminants that pose health concerns.

The WRT standard emphasizes that Category 2 water presents an elevated health risk and requires enhanced controls compared to Category 1. This may include increased PPE, more aggressive cleaning, and careful evaluation of materials for restorability. Porous materials affected by Category 2 water may need to be removed depending on exposure time and degree of absorption.

Importantly, the WRT body of knowledge highlights that water can degrade in category over time if left untreated. Category 2 water can become Category 3 due to microbial amplification, reinforcing the importance of timely mitigation and proper classification during the initial inspection.
