C_ABAPD_2507 Reliable Exam Questions - Exam C_ABAPD_2507 Tests

Our C_ABAPD_2507 exam materials are formally designed for the exam. With its help, you don't have to worry about the exam any more for it almost guarantees you get what you want. If you think I'm exaggerating, you might as well take a look at our C_ABAPD_2507 Actual Exam. With a high pass rate as 98% to 100%, you will be bound to pass the exam. And our C_ABAPD_2507 training questions are popular in the market. We believe you will make the right choice.

SAP Certified Associate - Back-End Developer - ABAP Cloud Sample Questions (Q77-Q82):

NEW QUESTION # 77

Which of the following are personas under the SAP S/4HANA Cloud Extensibility Framework?
(Select 2 correct answers)

- A. Report Writer
- B. Citizen Developer
- C. Workflow Administrator
- D. Business Expert

Answer: B,D

Explanation:

Comprehensive and Detailed Explanation from Exact Extract:

SAP S/4HANA Cloud Extensibility Framework defines personas for extension activities:

* Business Experts # implement extensions with business knowledge (using in-app extensibility).

* Citizen Developers # build extensions with low-code/no-code tools.

Report Writer and Workflow Administrator are roles, but not part of extensibility personas.

Verified Study Guide Reference: ABAP Cloud Extensibility Guide - Personas in SAP S/4HANA Cloud.

NEW QUESTION # 78

You have two database tables - ZDEPARTMENTS and ZEMPLOYEES. They are linked by a foreign key relationship: ZEMPLOYEES is the foreign key table and ZDEPARTMENTS is the check table. A department may have any number of employees (including none at all). What is the correct cardinality of the foreign key relationship?

- A. [0..1,1]
- B. [0..*,1]
- C. [1,1]
- D. [1,1]

Answer: B

NEW QUESTION # 79

Which of the following are valid sort operations for internal tables? Note: There are 3 correct answers to this question.

- A. Sort a standard table using
SORT itab ASCENDING.
Sort a sorted table using
- B. SORT itab DESCENDING.
- C. SORT itab.
Sort a sorted table using
- D. SORT itab BY field1 ASCENDING field2 DESCENDING.
Sort a standard table using
- E. SORT itab BY field1 field2.
Sort a standard table using

Answer: A,C,E

NEW QUESTION # 80

The class zcl_demo_class is in a software component with the language version set to "Standard ABAP". The function module "ZF11 is in a software component with the language version set to "ABAP Cloud". Both the class and function module are customer created. Regarding line #6, which of the following is a valid statement?

- A. 'ZF1' can be called whether it has been released or not for cloud development.
- B. 'ZF1' can be called via a wrapper that itself has not been released for cloud development.
- C. 'ZF1' must be released for cloud development to be called.
- D. 'ZF1' can be called via a wrapper that itself has been released for cloud development.

Answer: D

Explanation:

The function module ZF1 is in a software component with the language version set to "ABAP Cloud". This means that it follows the ABAP Cloud Development Model, which requires the usage of public SAP APIs and extension points to access SAP functionality

and data. These APIs and extension points are released by SAP and documented in the SAP API Business Hub1. Customer-created function modules are not part of the public SAP APIs and are not released for cloud development. Therefore, calling a function module directly from a class with the language version set to "Standard ABAP" is not allowed and will result in a syntax error. However, there is a possible way to call a function module indirectly from a class with the language version set to "Standard ABAP":

Create a wrapper class or interface for the function module and release it for cloud development. A wrapper is a class or interface that encapsulates the function module and exposes its functionality through public methods or attributes. The wrapper must be created in a software component with the language version set to "ABAP Cloud" and must be marked as released for cloud development using the annotation `@EndUserText.label`. The wrapper can then be called from a class with the language version set to "Standard ABAP" using the public methods or attributes2.

For example, the following code snippet shows how to create a wrapper class for the function module ZF1 and call it from the class `zcl_demo_class`:

```
@EndUserText.label: 'Wrapper for ZF1' CLASS zcl_wrapper_zf1 DEFINITION PUBLIC FINAL CREATE PUBLIC. PUBLIC SECTION. CLASS-METHODS: call_zf1 IMPORTING iv_a TYPE i iv_b TYPE i EXPORTING ev_result TYPE i. ENDCLASS. CLASS zcl_wrapper_zf1 IMPLEMENTATION. METHOD call_zf1. CALL FUNCTION 'ZF1' EXPORTING a = iv_a b = iv_b IMPORTING result = ev_result. ENDMETHOD. ENDCLASS. CLASS zcl_demo_class DEFINITION. METHODS: ml. ENDCLASS. CLASS zcl_demo_class IMPLEMENTATION. METHOD ml. DATA(lv_result) = zcl_wrapper_zf1=>call_zf1( iv_a = 2 iv_b = 3 ). WRITE: / lv_result. ENDMETHOD. ENDCLASS.
```

The output of this code is:

5

NEW QUESTION # 81

In RESTful Application Programming, which EML statement retrieves an object?

- A. Read entity
- B. Find entity
- C. Select entity
- **D. Get entity**

Answer: D

Explanation:

In RESTful Application Programming, the EML statement that retrieves an object is GET entity. The GET entity statement is used to read data of an entity instance from the database or the transaction buffer. The GET entity statement can specify the entity name, the entity key, and the entity elements to be retrieved. The GET entity statement can also use the IN LOCAL MODE addition to bypass the access control, authorization control, and feature control checks. The GET entity statement returns a single entity instance or raises an exception if no instance is found or multiple instances match the key.

The other EML statements are not used to retrieve an object, but have different purposes and effects. These statements are:

FIND entity: This statement is used to search for entity instances that match a given condition. The FIND entity statement can specify the entity name, the entity elements to be returned, and the condition to be applied. The FIND entity statement can also use the IN LOCAL MODE addition to bypass the access control, authorization control, and feature control checks. The FIND entity statement returns a table of entity instances or an empty table if no instances match the condition.

SELECT entity: This statement is used to query data of entity instances from the database or the transaction buffer. The SELECT entity statement can specify the entity name, the entity elements to be returned, and the filter, order, and aggregation options to be applied. The SELECT entity statement can also use the IN LOCAL MODE addition to bypass the access control, authorization control, and feature control checks. The SELECT entity statement returns a table of entity instances or an empty table if no instances match the query.

READ entity: This statement is not a valid EML statement, but an ABAP statement. The READ statement is used to access a single row of an internal table using the table index or the table key. The READ statement can also use the TRANSPORTING addition to specify which fields should be returned, and the INTO addition to specify the target variable. The READ statement returns a single row of the internal table or raises an exception if no row is found or multiple rows match the key.

NEW QUESTION # 82

.....

Free update for one year after purchasing is available for C_ABAPD_2507 study guide, therefore there is no need for you to spend

extra money on update version. And the update version for C_ABAPD_2507 exam dumps will be sent to your email automatically, you just need to check your email for the update version. Besides, C_ABAPD_2507 Exam Materials are compiled by experienced experts and, so the quality can be guaranteed. We have online and offline service, and they possess the professional knowledge for C_ABAPD_2507 exam materials, and if you have any questions, you can consult us.
