In today's world, the Pure Storage Certified FlashArray Implementation Specialist (FlashArray-Implementation-Specialist) certification exam has become increasingly popular, providing professionals with the opportunity to upskill and stay competitive in the tech industry. At Test4Sure, we understand the importance of obtaining the Pure Storage FlashArray-Implementation-Specialist Certification in the Pure Storage sector, where technological advancements constantly evolving.

Pure Storage Certified FlashArray Implementation Specialist Sample Questions (Q110-Q115):

NEW QUESTION # 110

Support requests a powercycle on a newly-installed FlashArray. What is the correct way to perform this action?

- A. Push the power button on each controller.
- **B. Run purearray reboot.**
- C. Unplug the cable on each power supply.

Answer: B

Explanation:

The proper and safe method to power cycle a FlashArray is to run the purearray reboot command, which gracefully restarts the system without risking data integrity or hardware issues.

NEW QUESTION # 111

When should a FlashArray support case be opened?

- **A. Before starting install**
- B. Once install is completed
- C. Once an issue arises

Answer: A

Explanation:

A FlashArray support case should be opened before starting the installation (Option C).

Proactive Support: Pure Storage advocates for a proactive support model. Opening a case (often categorized as an "Install" or "Planned Event" ticket) prior to the engineer arriving onsite or beginning the physical work serves multiple purposes:

Notification: It alerts Pure Support that a new array is about to come online.

Validation: It allows Support to verify the serial number, entitlement, and ensure the array is ready to receive the latest Purity updates or patches immediately upon connection.

Remote Assist: It establishes a placeholder for the "Health Check" phase. Once the physical install is done, the engineer can immediately reference this existing case number when enabling Remote Assist, allowing a Technical Support Engineer (TSE) to quickly jump in and perform the final validation without the delay of ticket creation and routing.

Waiting until an issue arises (Option A) is reactive, and waiting until completion (Option B) delays the mandatory sign-off process.

NEW QUESTION # 112

What is the maximum number of SAS shelves supported for FlashArray//XL?

- A. 0
- B. 1
- C. 2

Answer: C

Explanation:

The FlashArray//XL supports up to two DirectFlash Shelves (DFS) for capacity expansion. This configuration allows for scalable storage solutions while maintaining optimal performance and efficiency. Each shelf can be connected to the array using appropriate interfaces, ensuring seamless integration and data flow. This setup is particularly beneficial for environments requiring high throughput and low latency, such as large-scale databases and enterprise applications.

NEW QUESTION # 113

When should a FlashArray support case be opened?

- A. Before starting install
- B. Once install is completed
- C. Once an issue arises

Answer: A

Explanation:

Opening a support case before starting the installation ensures timely assistance and coordination with support throughout the deployment process.

NEW QUESTION # 114

An Implementation Engineer is installing the first DirectFlash Shelf (DFS) on a FlashArray//XR4 controller. Which ports should the Implementation Engineer use for the connection?

- A. ETH 18/19
- B. ETH 10/11
- C. ETH 0/1
- D. ETH 6/7

Answer: A

Explanation:

When adding external capacity to a Pure Storage FlashArray via a DirectFlash Shelf (DFS), Implementation Engineers must adhere to strict, high-speed networking port assignments to ensure maximum backend throughput. Unlike older Fibre Channel or basic SAS expansion shelves that use dedicated SAS cabling, a modern DFS relies on massive 50GbE or 100GbE bandwidth using the NVMe-oF (RDMA over Converged Ethernet - RoCE) protocol to maintain NVMe-level speeds across the external fabric. According to the official FlashArray//XR4 Port Usage and Definitions hardware matrix, the onboard 100GbE RoCE ports explicitly dedicated to the first loop of a DirectFlash Shelf are physically located on the controllers and identified within the Purity operating system as ETH 18 and ETH 19 .

These specific ports are hardware-optimized to handle the extreme backend IOPS generated by the external DirectFlash Modules communicating back to the primary chassis. Utilizing standard 1GbE/10GbE management/replication ports (such as ETH 0/1) or other generic PCIe Ethernet host interfaces (such as ETH 10/11) is unsupported for the primary DFS backend loop. Plugging the shelf into the wrong ports will result in cabling validation failures during the hardware_check.py execution, preventing the new capacity from being recognized by the array.
