New UiPath-AAAv1 Exam Pdf & UiPath-AAAv1 Learning Engine

The scoring system of our UiPath-AAAv1 exam torrent absolutely has no problem because it is intelligent and powerful. First of all, our researchers have made lots of efforts to develop the scoring system. So the scoring system of the UiPath-AAAv1 test answers can stand the test of practicability. Once you have submitted your practice. The scoring system will begin to count your marks of the UiPath-AAAv1 exam guides quickly and correctly. You just need to wait a few seconds before knowing your scores. The scores are calculated by every question of the UiPath-AAAv1 Exam guides you have done. So the final results will display how many questions you have answered correctly and mistakenly. You even can directly know the score of every question, which is convenient for you to know the current learning condition.

UiPath Certified Professional Agentic Automation Associate (UiAAA) Sample Questions (Q17-Q22):

NEW QUESTION # 17

What type of agents can be invoked using the 'Start and wait for external agent' feature in UiPath Maestro?

- A. Agents that do not require any input or output variables.
- B. External agents like Salesforce or ServiceNow.
- C. Only UiPath Orchestrator robots.
- **D. Agents configured exclusively within the same project.**

Answer: D

Explanation:

C is the correct answer - the "Start and wait for external agent" feature in UiPath Maestro is used to invoke another agent that has been configured within the same project or automation environment.

This enables:

- * Agent-to-agent chaining
- * Modular design where complex tasks are offloaded to specialized agents
- * Return of results or outputs, once the external agent completes its task
- * Properly configured
- * Input/output ready
- * Available within the orchestration context of the same solution

Option A is incorrect - this feature is about agents, not robots.

B is wrong - external platforms like Salesforce are accessed via connectors, not as agents.

D is false - input/output parameters can and often should be used between agents.

NEW QUESTION # 18

You want your agent to call an existing UiPath process by adding it in the Tools # Processes. Which prerequisite must be met before the process becomes selectable?

- A. The process only appears if it exposes at least one String output argument, regardless of where it is deployed, otherwise the Agent tool would be irrelevant for the Agent.
- B. Any process published anywhere in the tenant automatically appears in the list without additional deployment or permissions.
- **C. The process must already be published and deployed to a shared Orchestrator folder that you (and the agent) have permission to access.**
- D. The process only appears if it exposes at least one String input argument, regardless of where it is deployed, otherwise the Agent tool would be irrelevant for the Agent.

Answer: C

Explanation:

B is the correct answer - in UiPath's Agent Builder (Studio Web), when you want to invoke an existing UiPath process from an agent (via Tools # Processes), that process must meet two key prerequisites:

- * It must be published and deployed to a shared Orchestrator folder
- * You - and the agent - must have access to that folder

This ensures that:

- * The agent can locate and run the process at execution time
 - * Role-based access control (RBAC) is respected
 - * Input/output arguments, execution logs, and exceptions are properly managed within the correct environment
- This aligns with UiPath's Orchestrator-integrated agent orchestration model, where security and deployment visibility are tightly governed. It also allows agent authors to reuse existing RPA logic inside dynamic agent flows without duplicating automation work.

Option A and D incorrectly imply that argument types affect process visibility - that's false. Agents can invoke processes with any argument signature, as long as mapping is defined.

Option C is incorrect - publishing alone is not enough. Deployment and permissions are required for the process to appear in the tool selector.

This model ensures that agents can call any compliant UiPath process securely, reliably, and in line with enterprise governance.

NEW QUESTION # 19

When passing runtime data into an Agent, which approach ensures the input argument is actually available inside the user prompt at execution time?

- A. Simply mention the variable name in plain prose - the Agent will infer the value from the workflow without special syntax.
- B. Declare the argument in the system prompt; any text surrounded by angle brackets (e.g., <CUSTOMER_EMAIL>) will be substituted automatically.
- **C. Create the argument in Data Manager and reference it verbatim inside double curly braces, e.g., {{CUSTOMER_EMAIL}}, so the name matches exactly.**
- D. Use single braces like {CUSTOMER_EMAIL}, because the platform automatically normalizes the identifier.

Answer: C

Explanation:

B is correct - to pass runtime values into an agent's prompt in UiPath, you must:

- * Declare the variable in Data Manager
- * Reference it inside the user/system prompt using double curly braces, e.g., `{{CUSTOMER_EMAIL}}` This ensures the platform can:
 - * Substitute values at runtime
 - * Maintain traceability between arguments and prompts
 - * Provide context grounding for the LLM

Option A is incorrect - angle brackets are not used for substitution.

C is wrong - single braces `{}` are not valid for UiPath's binding syntax.

D is unreliable - LLMs do not infer values from prose without structured substitution.

This technique ensures consistent parameter injection for context-aware agent behavior.

NEW QUESTION # 20

What steps must be completed when creating evaluations from scratch for a new evaluation set in UiPath?

- A. Once the evaluation set is created, all included evaluations are automatically scored based only on input values and expected outputs.
- **B. Add a name to the evaluation set, provide input values and expected output, save each evaluation, and assign evaluators before running the evaluation set.**
- C. Assign evaluators immediately after creating the new evaluation set name, then configure inputs and expected outputs later.
- D. The evaluation set can only be created using imported JSON data from previous evaluations of other agents.

Answer: B

Explanation:

B is correct - creating a new evaluation set in UiPath involves a multi-step process designed to enable qualitative and quantitative review of agent behavior.

Steps include:

- * Naming the evaluation set
- * Adding input prompts and expected outputs
- * Saving each test item (often called "evaluations")
- * Assigning evaluators, who will manually or automatically score the results This process enables testable, repeatable evaluation of agent behavior before deployment - ensuring the model produces correct, useful, and safe outputs.

Options A and C are incorrect:

- * A reverses the order: inputs and expected outputs are needed before evaluators.
- * C is false - evaluation sets can be built from scratch. D implies scoring is automatic, but human reviewers or comparison logic are often required for nuanced evaluations.

This aligns with UiPath's best practices in agent validation and post-deployment assurance.

NEW QUESTION # 21

Which configuration area defines what the agent should do after a human resolves the escalation?

- A. Inputs description fields
- B. Assignment recipient list
- **C. Outcome behavior section**
- D. Agent Memory toggle

Answer: C

Explanation:

The correct answer is D - the Outcome Behavior section is where you configure how the agent should respond once an escalation is resolved by a human.

In UiPath's agent design process, when a task is escalated to a human reviewer (via Action Center, for instance), the agent:

- * Waits for human input
- * Receives an Outcome (e.g., Approve, Reject, Flag)
- * Then continues its process based on logic defined in the Outcome Behavior This may include:
 - * Proceeding with the automation
 - * Triggering an alternate flow

* Logging results or escalating further

Other options are incorrect or refer to unrelated settings:

* A (Assignment recipient list) defines who gets the task - not what happens after.

* B (Agent Memory toggle) governs context retention, not post-escalation behavior.

* C (Input descriptions) help users understand fields but don't control flow logic.

The Outcome Behavior section ensures agents respond intelligently and consistently after human interaction, which is critical in hybrid workflows involving both automation and human-in-the-loop review.
