Web-based International Code Council Fire-Inspector-II Practice Test Software: Identify and Fill Your Knowledge Gaps Online

You should prepare with Prep4King Fire-Inspector-II Questions that are in compliance with Fire-Inspector-II exam content. More than 90,000 professionals worldwide have provided their feedback, helping create and launch Fire-Inspector-II questions in the market. So, if you're determined to pass the International Code Council exam and achieve Fire-Inspector-II Certification to accelerate your career, it's time to build your knowledge and skills. You can try the demo version of 67 - Fire Inspector II Exam (Fire-Inspector-II) practice dumps before payment.

International Code Council 67 - Fire Inspector II Exam Sample Questions

(Q70-Q75):

NEW QUESTION # 70

The clearance requirement from structures for open burning may be reduced to a minimum of ____ ft. from a structure when the burning is conducted in an approved container.

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

For open burning, fire codes typically require a minimum clearance from structures to prevent fire spread.

However, when burning is conducted in an approved container, the required clearance distance may be reduced to 15 feet.

Reference to Fire Inspector Documentation:

1. 2021 International Fire Code (IFC) - Section 307.4 (Open Burning, Recreational Fires, and Portable Outdoor Fireplaces) IFC 307.4 states that the minimum clearance for open burning is 50 feet but may be reduced to 15 feet when conducted in an approved container that prevents fire spread.

2. NFPA 1 - Fire Code (2021 Edition) - Section 10.11 (Open Burning and Recreational Fires) NFPA 1, Section 10.11.5 aligns with the IFC and allows a minimum of 15 feet clearance for contained burning in approved receptacles.

Detailed Explanation of Answer Choices:

Option A (Incorrect): 10 ft. is too close and does not meet the IFC minimum requirement.

Option B (Correct): 15 ft. is the minimum required distance for burning in an approved container according to IFC 307.4.

Option C (Incorrect): 25 ft. is the standard for recreational fires but not for approved containers.

Option D (Incorrect): 50 ft. applies to open burning without a container, not when using an approved container.

Thus, the correct and verified answer is: B. 15 ft.

NEW QUESTION # 71

Which of the following situations requires securing of an operational permit from the code official prior to commencing the related activity?

- A. Fruit ripening operations using carbon dioxide gas.
- B. Organic coating production facility producing 2 gallons per day.
- C. Storing 85,000 bd. ft. of lumber.
- D. Inside storage of 100 cu. ft. of baled cotton.

Answer: C

Explanation:

IFC Section 105.6 lists activities requiring operational permits. For A, lumber storage exceeding 100,000 board feet (bd. ft.) indoors or outdoors requires a permit (Section 105.6.28, Lumber Yards), but local thresholds may be lower-85,000 bd. ft. is close to this limit and likely exceeds typical exempt amounts, triggering a permit in many jurisdictions. For B, IFC Table 3206.2 allows small quantities of combustible commodities like baled cotton (100 cu. ft. is minimal) without a permit unless part of a larger high-piled storage operation. For C, fruit ripening with CO₂ (Section 105.6.13) requires a permit only for specific flammable gases, not CO₂ alone, which is nonflammable. For D, organic coating production (Section

105.6.33) requires a permit only above 1 gallon per day, but 2 gallons is still small-scale and context-dependent-lumber storage is the clearer permit trigger here. Thus, A is the best answer.

NEW QUESTION # 72

Fine magnesium scrap stored in quantities greater than 1,000 cu. ft. shall be separated from all buildings other than those used for magnesium scrap recovery operations by a distance of not less than ____ ft.

- A. 0
- B. 1
- C. 2
- D. 3

Answer: B

Explanation:

Storage of fine magnesium scrap is regulated under 2021 IFC Chapter 59 - Magnesium and specifically IFC Section 5904.3.2.5 - Separation Distances for Magnesium Scrap Storage.

IFC 5904.3.2.5 - Minimum Separation Distances:

Fine magnesium scrap in quantities greater than 1,000 cubic feet must be separated from all buildings (except those used for magnesium scrap recovery) by at least 250 feet.

Why Other Options Are Incorrect?

A: 30 feet - Too close; insufficient for high-risk metal fires.

B: 50 feet - Does not meet the minimum required separation for magnesium scrap.

C: 100 feet - While larger, it still does not meet the 250-ft. requirement

NEW QUESTION # 73

A Type I handrail that is not circular shall have a minimum perimeter dimension of ____ inches.

- A. 0
- B. 1
- C. 1.25
- D. 6.25

Answer: D

Explanation:

According to the 2021 International Fire Code (IFC) and the International Building Code (IBC) Section 1014.3, handrails are categorized into Type I and Type II based on their shape and size requirements.

Type I handrails refer to those that are not circular in shape but still comply with graspability requirements.

IBC Section 1014.3.1 states that:

If a handrail is not circular, it must have a perimeter dimension between 4 inches (minimum) and 6.25 inches (maximum).

The cross-section of such a handrail should provide an adequate grasping surface.

NEW QUESTION # 74

When adequate openings are provided on only one exterior wall of a story in an office building, an automatic sprinkler system shall be installed when the wall opposite the openings is more than ____ ft. away.

- A. 0
- B. 1
- C. 2
- D. 3

Answer: B

Explanation:

Reference to Automatic Sprinkler Requirements:

The International Fire Code (IFC 2021), Section 903.2.11.1 and NFPA 13 (Standard for Installation of Sprinkler Systems) regulate when sprinkler systems are required based on ventilation and fire spread potential.

A building with only one exterior wall providing openings creates a fire trap, increasing the need for automatic sprinklers.

Determining the Required Distance:

IFC 903.2.11.1 states that when the wall opposite the provided openings is more than 100 feet away, an automatic sprinkler system must be installed to ensure proper fire suppression.

Clarification of Incorrect Answer Choices:

A: 50 ft. # Incorrect

Sprinklers are not necessarily required at this distance because natural ventilation is still effective.

B: 75 ft. # Incorrect

This distance still allows some natural ventilation, making sprinklers optional rather than mandatory.

D: 150 ft. # Incorrect

Sprinklers are required once the distance exceeds 100 feet, so waiting until 150 feet would not meet code requirements.

Conclusion:

The correct and verified answer is C (100 feet) based on IFC 903.2.11.1 and NFPA 13, ensuring fire safety in office buildings with

limited exterior openings.

NEW QUESTION # 75

.....

Online test version is the best choice for IT person who want to feel the atmosphere of International Code Council real exam. And you can practice latest Fire-Inspector-II exam questions on any electronic equipment without any limit. Besides, there is no need to install any security software because our Fire-Inspector-II Vce File is safe, you just need to click the file and enter into your password.
