## Cisco Understanding Cisco Cybersecurity Operations Fundamentals Sample Questions (Q154-Q159):

### NEW QUESTION # 154

Refer to the exhibit.

Which event is occurring?

- A. A binary on VM cuckoo1 is being submitted for evaluation
- B. A binary named "submit" is running on VM cuckoo1.
- **C. A binary is being submitted to run on VM cuckoo1**
- D. A URL is being evaluated to see if it has a malicious binary

**Answer: C**

Explanation:

The command "\$ cuckoo submit --machine cuckoo1 /path/to/binary" indicates that a binary located at "/path/to/binary" is being submitted to be run on a virtual machine named "cuckoo1". This is a common practice in cybersecurity to analyze the behavior of suspicious files in an isolated environment. ### NEW QUESTION # 156

How does a certificate authority impact security?

- A. It authenticates client identity when requesting an SSL certificate.
- B. It authenticates domain identity when requesting an SSL certificate.
- C. It validates client identity when communicating with the server.
- **D. It validates the domain identity of the SSL certificate.**

**Answer: D**

Explanation:

A certificate authority (CA) is a trusted entity that issues and manages digital certificates for secure communication over the internet. A digital certificate is a document that contains the public key and the identity of the owner of the key. A CA impacts security by validating the domain identity of the SSL certificate, which is a type of digital certificate that enables encrypted communication between a web server and a web browser. The CA verifies that the domain name in the certificate matches the domain name of the web server, and signs the certificate with its own private key. The web browser can then verify the signature of the CA and trust the identity of the web server.
