

EAEP2201 Exam Torrent Materials and EAEP2201 Study Guide Dumps - Pass4sures

BONUS!!! Download part of Pass4sures EAEP2201 dumps for free: <https://drive.google.com/open?id=1I2F269oFg4vsDfBpPqbmQu2ATPRtN-VR>

Begin to learn the EAEP2201 exam questions and memorize the knowledge given in them. Only ten days is enough to cover up the content and you will feel confident enough that you can answer all EAEP2201 Questions on the syllabus of EAEP2201 certificate. Such an easy and innovative study plan is amazingly beneficial for an ultimately brilliant success in exam.

Esri EAEP2201: Enterprise Administration Professional 2201 exam is designed to test a candidate's ability to manage ArcGIS Enterprise deployments. EAEP2201 exam covers a wide range of topics related to installation, configuration, security, and performance tuning. It is intended for experienced GIS professionals who have a good understanding of ArcGIS Enterprise and IT concepts. Passing the exam is a significant achievement that can help professionals advance their careers and increase their earning potential.

To be successful in EAEP2201 Exam, candidates should have hands-on experience in configuring and maintaining ArcGIS Enterprise systems in a production environment. They should be familiar with the different types of server installations, such as stand-alone servers and multi-machine deployments. Candidates should also be proficient in troubleshooting ArcGIS Enterprise systems and resolving common technical issues that may arise.

EAEP2201 Lead2pass | EAEP2201 Free Braindumps

Our EAEP2201 study materials are the best choice in terms of time and money. And all contents of EAEP2201 training prep are made by elites in this area. Furthermore, EAEP2201 Quiz Guide gives you 100 guaranteed success and free demos. To fit in this amazing and highly accepted EAEP2201 Exam, you must prepare for it with high-rank practice materials like our EAEP2201 study materials. We can ensure your success on the coming exam and you will pass the EAEP2201 exam just like the others.

Esri EAEP2201 Certification Exam covers a wide range of topics related to ArcGIS Enterprise administration, including installation and configuration, security, performance tuning, high availability, and disaster recovery. Successful candidates will have a deep understanding of the best practices for deploying and managing ArcGIS Enterprise, as well as the ability to troubleshoot and resolve issues that may arise.

Esri Enterprise Administration Professional 2201 Sample Questions (Q20-Q25):

NEW QUESTION # 20

A single Linux machine deployment of ArcGIS Enterprise has a home partition of 20 GB, a /data partition of 150 GB, and an /opt partition of 75 GB.

Where should the configuration store and directories be located?

- A. /data
- B. /opt
- C. /home

Answer: A

Explanation:

The configuration store and server directories for ArcGIS Enterprise should be placed in a partition with ample disk space and stable read/write performance, as these directories store logs, cache, uploads, and critical site configuration information.

In this scenario:

- * The /home partition (20 GB) is insufficient for growth and operational overhead.
 - * The /opt partition (75 GB) is moderately sized but still smaller than the /data partition.
 - * The /data partition (150 GB) provides the most space, making it the best choice to ensure scalability and system reliability.
- Best practice from ArcGIS Enterprise documentation recommends placing server directories and configuration stores on high-capacity partitions like /data when available.

NEW QUESTION # 21

An organization publishes a map image layer to ArcGIS Enterprise that references data from a user-managed PostgreSQL geodatabase.

The schema of a table is updated to add a field, but the map service cannot be stopped due to a Service Level Agreement (SLA). Schema locking is disabled.

Even after restarting the map service and database, the new field is not shown in the REST endpoint.

Which action should the administrator perform?

- A. Re-enable schema locking for the map service
- B. Clear the enterprise geodatabase cache
- C. Republish the map service by overwriting the original
- D. Ensure that the field is made visible by default in the ArcGIS Enterprise portal

Answer: C

Explanation:

Map image layers (map services) do not automatically detect schema changes, especially in registered enterprise geodatabases. Even with schema locking disabled, services cache the original schema at the time of publishing. To reflect the new field, you must overwrite the existing service.

From ArcGIS Server documentation:

"If the schema of a dataset is changed after a service is published (such as adding a field), the change is not automatically reflected in the service. You must overwrite the service or republish the map to reflect schema updates."

- * OptionBis not applicable; field visibility in the portal reflects what's in the published service definition.
- * OptionCis related to editing access, not field visibility.
- * OptionDis not a valid administrative action in this context.

NEW QUESTION # 22

A GIS administrator must determine which type of service to use when publishing a new basemap for the organization. The basemap must meet several requirements:

- * Support offline workflows
- * Use as little storage space as possible
- * High-resolution display
- * Easily incorporate data updates periodically made to a feature service Which service type should be used?

- A. Vector tile service
- B. Cached map service
- C. Dynamic map service

Answer: C

NEW QUESTION # 23

Multiple users report that a map service is experiencing negative performance. Upon review of ArcGIS Monitor data, the GIS analyst finds the following:

- * The minimum number of instances is 2 and the maximum is 8 for that service.
- * The data is in a publication Enterprise Geodatabase with no system usage in excess of 50%.
- * At the p75 level of requests, the map service time is 10 times longer than the service time at the p25 level.
- * The number of instances in use at the p50 level is 8.
- * The maximum % of physical memory in use is 40%, and the maximum % of virtual memory in use is 44% on the ArcGIS Server.
- * The maximum % CPU utilization observed is 53%.

What is causing the issue?

- A. The maximum instance setting is too low for the demand on the underperforming map service.
- B. The client is an Android device, and the ArcGIS Server is a Linux virtual machine.
- C. The network connection between the database server and ArcGIS Server is saturated.

Answer: A

Explanation:

The ArcGIS Monitor data indicates that the map service is reaching its maximum configured instances (8) at the median usage level (p50), suggesting that the service cannot scale to meet higher demand. The significant increase in service time at the p75 level further supports that the service is under-provisioned. Since system resources like CPU and memory are not fully utilized, the bottleneck is likely due to the instance configuration. Increasing the maximum number of instances would allow the service to handle more concurrent requests, improving performance.

There is no evidence of network saturation or client-specific issues affecting performance in this scenario.

NEW QUESTION # 24

A GIS administrator receives reports from users about a map service that is slow to draw. The service has the following characteristics:

- * Numerous detailed features
- * Complex symbology
- * Scale-dependent rendering
- * Infrequently updated
- * Query capability enabled
- * Uses shared instances

Which action should the administrator perform?

- A. Use dedicated instances instead of shared instances
- B. Eliminate scale-dependent rendering
- C. Configure the map service to use cached tiles

Answer: C

Explanation:

For map services that are infrequently updated and contain numerous detailed features with complex symbology, configuring the service to use cached tiles is the most effective way to improve drawing performance. Cached map services pre-render map images at various scales and store them, allowing for faster display to users. This approach is particularly beneficial when the data does not change frequently, as it reduces the server's processing load during user interactions.

Eliminating scale-dependent rendering (Option B) may lead to performance degradation, as it could result in rendering all features at all scales, increasing the amount of data processed and displayed unnecessarily.

Switching to dedicated instances (Option C) can improve performance in some scenarios, but it also increases resource usage on the server. Given that the service is infrequently updated and the primary concern is drawing performance, caching is the more efficient and scalable solution.
