Salesforce Salesforce-MuleSoft-Developer-I Exam Syllabus Topics:

Topic	Details
Topic 1	• Debugging and Troubleshooting Mule Applications: Using breakpoints to inspect a Mule event during runtime, installing missing Maven dependencies, and reading and deciphering Mule log error messages are sub-topics of this topic.
Topic 2	• Creating Application Networks: The topic of creating Application Networks encompasses understanding MuleSoft's proposal for closing the IT delivery gap and describing the role and characteristics of the modern API. It also includes the purpose and roles of a Center for Enablement (C4E), and the benefits of API-led.
Topic 3	• Deploying and Managing APIs and Integrations: It includes packaging Mule applications for deployment and deploying them to CloudHub. This topic also involves using CloudHub properties, creating and deploying API proxies, connecting an API implementation to API Manager, and applying policies to secure an API.
Topic 4	• Handling Errors: Handling errors includes describing default error handling in Mule applications and defining custom global default error handlers. It involves comparing On Error Continue and On Error Propagate scopes, creating error handlers for a flow, using the Try scope, and mapping errors to custom application errors.

Topic 5	• Processing Records: Processing records includes methods for processing individual records in a collection and explaining how Mule events are processed by the For Each scope. It also involves using the Batch Job with Batch Steps and a Batch Aggregator.
Topic 6	• Designing APIs: Designing APIs involves describing the lifecycle of the modern API and using RAML to define various aspects of an API. It includes identifying when to use query parameters vs URI parameters, and defining API parameters.
Topic 7	• Structuring Mule Applications: Structuring Mule applications covers parameterizing an application and defining and reusing global configurations. It includes breaking an application into multiple flows using private flows, subflows, and the Flow Reference component.

Salesforce Certified MuleSoft Developer (Mule-Dev-201) Sample Questions (Q223-Q228):

NEW QUESTION # 223
Refer to the exhibits.

The two Mule configuration files belong to the same Mule project. Each HTTP Listener is configured with the same host string and the port number, path, and operation values are shown in the display names.

What is the minimum number of global elements that must be defined to support all these HTTP Listeners?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: B

Explanation:

In this case three configurations will be required each for port 8000, 6000 and 7000.

There would be three global elements defined for HTTP connections.

Each HTTP connection will have host and port. One example shown below with host as localhost and port 6000

Graphical user interface, application Description automatically generated

To use an HTTP listener, you need to declare a configuration with a corresponding connection. This declaration establishes the HTTP server that will listen to requests.

Additionally, you can configure a base path that applies to all listeners using the configuration.

* <http:listener-configname="HTTP_Listener_config"basePath="api/v1">
* <http:listener-connectionhost="0.0.0.0"port="8081"/>
* </http:listener-config>

NEW QUESTION # 224

A Mule application's HTTP Listener is configured with the HTTP protocol. The HTTP listeners port attribute is configured with a property placeholder named http.port. The mule application sets the http.port property placeholder's value to 9090 The Mule application is deployed to CloudHub without setting any properties in the Runtime manager Properties tab and a log message reports the status of the HTTP listener after the Mule application deployment completes.

After the mule applications is deployed, what information is reported in the worker logs related to the port on which the Mule application's HTTP Listener listens?

- A. The HTTP Listener is listening on port 9090
- B. The HTTP Listener failed to bind to the port and is not listening for connections
- C. The HTTP Listener is listening on port 80
- D. The HTTP Listener is listening on port 8081

Answer: D

Explanation:
Cloudhub expose services on port 8081 and override value in http.port with this one .
Sample log in Runtime Manager is below
21:15:53.148 08/08/2021 Worker-0 ArtifactDeployer.start.01 INFO
Listening for connections on 'http://0.0.0.0:8081'

NEW QUESTION # 225

Refer to the exhibits. The main flow contains an HTTP Request in the middle of the flow. The HTTP Listeners and HTTP Request use default configurations.

A web client submits a request to the main flow's HTTP Listener that includes query parameters for the pedigree of the piano. What values are accessible to the Logger component at the end of the main flow?

```
<http:request method="POST" doc:name="POST HTTP /child" url="http://localhost:8081/child">
</http:request>
<logger level="INFO" doc:name="Logger"/>
</flow>

<flow name="child" >
<http:listener doc:name="HTTP POST /child"  config-ref="HTTP_Listener_config" path="/child"/>
```

- A. payload
- B. payload
  pedigree query params
- C. payload
  pedigree query params producer var
- D. payload
  producer var

Answer: D

Explanation:
In this case as outbound call is made using HTTP: POST /child , all attributes will be replaced by this invocation. Hence query parameter will not be accessible at logger. Hence correct answer is option 2

NEW QUESTION # 226
What is output of Dataweave flatten function?

- A. Object
- B. LInkedHashMap
- C. Map
- D. Array

Answer: D

Explanation:
Correct answer is Array.
Flatten turns a set of subarrays (such as [[1,2,3], [4,5,[6]], [], [null]]) into a single, flattened array (such as [1, 2, 3, 4, 5, [6], null]).
This example defines three arrays of numbers, creates another array containing those three arrays, and then uses the flatten function to convert the array of arrays into a single array with all values.
Source
%dw 2.0
output application/json
var array1 = [1,2,3]
var array2 = [4,5,6]
var array3 = [7,8,9]
var arrayOfArrays = [array1, array2, array3]
---
flatten(arrayOfArrays)
Output
[1,2,3,4,5,6,7,8,9]

Refer to the exhibits.

A web client submits a request to below flow. What is the output at the end of the flow?

```

- A. XML
- B. Object
- C. String
- D. Java

Answer: C

Explanation:
String is the correct answer as XML is of an Object type String
