## GIAC Global Industrial Cyber Security Professional (GICSP) Sample Questions (Q70-Q75):

### NEW QUESTION # 70

What is the purpose of conducting a risk assessment when developing an ICS security program?

Response:

- A. To increase data storage capacity
- **B. To identify and prioritize potential threats**
- C. To simplify software updates
- D. To determine network speeds

**Answer: B**

### NEW QUESTION # 71

Which type of attack could result from exploiting a vulnerability in Level 0 devices, such as sensors?

Response:

- A. Sensor spoofing
- B. SQL injection
- C. Ransomware attack
- D. Distributed Denial of Service (DDoS)

**Answer: A**

### NEW QUESTION # 72

How could Wireshark be utilized in an attack against devices at Purdue levels 0 or 1?

- A. Detect asymmetrical keys by identifying randomness in a data dump
- B. Capture serial and fieldbus communications sent by networked devices
- C. Brute force crypto keys in an encrypted pcap file
- D. Capture communications between chips on a board
- E. Detect open ports on a device by sending packets and analyzing the responses

**Answer: B**

Explanation:

Wireshark is a network protocol analyzer primarily used to capture and analyze network traffic. At Purdue levels 0 or 1 (which include physical devices like sensors, actuators, and controllers communicating over industrial protocols), Wireshark can be used to: Capture serial and fieldbus communications (A), such as Modbus, Profibus, or Ethernet-based protocols, if the network media is accessible. This can reveal sensitive operational data and control commands.

Wireshark cannot capture communications between chips on a board (B) because this is hardware-level, not network traffic.

Detecting open ports by sending packets (C) is a function of port scanning tools, not Wireshark.

Detecting asymmetrical keys or brute forcing crypto keys (D and E) are not capabilities of Wireshark.

The GICSP training highlights the risk of passive monitoring via tools like Wireshark as a means for attackers to gain insight into control system operations.

### NEW QUESTION # 73

What is a characteristic of Windows Server Update Services (WSUS) in an ICS environment?

- A. Inventories both hardware and software within an Active Directory domain
- B. Requires the clients to connect to the Internet to download patches
- C. Allows the administrator to create custom groups of computers

**Answer: C**

Explanation:

WSUS enables centralized patch management and allows administrators to create custom groups of computers (C) to target updates and schedules appropriately, which is useful in segmented ICS environments.

WSUS clients do not require direct Internet access (A) as WSUS servers can download updates centrally.

WSUS does not perform hardware or software inventory (B); that functionality is provided by other tools like MECM.

GICSP highlights WSUS as a practical tool for managing patches in ICS with fine-grained control.

### NEW QUESTION # 74

What approach can an organization use to make sure that high consequence, low probability risks are considered during risk analysis?

- **A. Prioritize risks based on impact**
- B. Give frequency a higher weight
- C. Prioritize risks based on mitigation cost
- D. Give likelihood a higher weight

**Answer: A**

Explanation:

In risk analysis, high consequence, low probability risks-such as catastrophic failures or attacks-require special attention. The best approach to ensure these risks are properly considered is to prioritize risks based on impact (A), focusing on the potential severity of consequences if the event occurs, regardless of its frequency.

Giving frequency or likelihood (B, D) a higher weight can lead to underestimating rare but highly damaging risks.

Mitigation cost (C) is a factor in decision-making but does not ensure identification or prioritization of high- impact risks.

GICSP emphasizes a balanced risk management process where impact or consequence is a critical criterion, especially in ICS environments where safety and critical infrastructure availability are paramount.
