VMware Cloud Foundation 5.2 Administrator Sample Questions (Q133-Q138):

NEW QUESTION # 133

Following an internal security audit of the new VMware Cloud Foundation (VCF) instance, the following audit finding was documented for priority remediation:

All users from the custom administrators group could access the Direct Console User Interface (DCUI) on all ESXi hosts within the workload domain. RISK=High, IMPACT=High The company IT security policy around accessing ESXi servers states the following:

Users within the custom administrators group must access ESXi host configurations from within vCenter Server or the vSphere Web Client only.

Only users within the restricted administrators group must be allowed direct access to ESXi hosts.

Which two actions should the administrator perform on each of the hosts within the workload domain to remediate the security finding? (Choose two.)

- A. Add the restricted administrators group to the DCUI.Access advanced system setting.
- B. Disable SSH and the ESXi Shell.
- C. Enable Strict Lockdown Mode.
- D. Enable Normal Lockdown Mode.
- E. Add the custom administrators group to the DCUI.Access advanced system setting.

Answer: A,D

NEW QUESTION # 134

While troubleshooting a vSphere HA cluster issue, an administrator observes that a host is in the Network Isolated state. The host is unable to ping the configured isolation address and cannot access any other vSphere HA agents.

Which step would resolve this issue while minimizing downtime for running virtual machines (VMs)?

- A. Reconfigure the isolation addresses to ensure the host can ping the default gateway or other configured IPs.
- B. Restart the vSphere HA services on the isolated host to trigger the election of a new primary agent.
- C. Power off all VMs on the isolated host, remove the host from the cluster, and add it back after the network is fixed.
- D. Reconfigure the host's HA agent to bypass the isolation check and allow VM operations to continue.

Answer: A

Explanation:

Ensuring the host's isolation addresses include reachable targets (such as the default gateway) allows the HA agent to detect network connectivity correctly without taking action on running VMs, resolving the isolation state with minimal disruption.

NEW QUESTION # 135

An organization is planning to manage a diverse set of databases across multiple VMware Cloud Foundation environments. Which three capabilities of Data Services Manager would help in managing these databases efficiently? (Choose three.)

- A. Policy-based backup and recovery for databases.
- B. Automated database provisioning and deployment.
- C. Centralized monitoring and alerting for all managed databases.
- D. Integration with vSAN for optimized storage management
- E. Automated VM migration between on-premises and cloud environments.

Answer: A,B,C

Explanation:

Centralized monitoring and alerting for all managed databases: Data Services Manager enables centralized monitoring and alerting for databases across multiple environments, providing visibility and proactive management.

Policy-based backup and recovery for databases: Data Services Manager allows for the implementation of backup and recovery policies to ensure the safety and availability of databases.

Automated database provisioning and deployment: With Data Services Manager, administrators can automate the deployment and provisioning of databases, streamlining the management process.

NEW QUESTION # 136

An organization needs to perform maintenance on a specific host in a vSAN cluster. An administrator is required to put the host into maintenance mode whilst ensuring that all VMs in the cluster remain accessible.

Which three steps should the administrator take to correctly set a vSAN host into maintenance mode? (Choose three.)

- A. Select the "No Data Migration" option to speed up the process.
- B. Choose the "Ensure Accessibility" option to maintain data accessibility.
- C. Migrate all VMs manually from the host before enabling maintenance mode.
- D. Right-click the host and select "Enter Maintenance Mode."
- E. Navigate to the vSAN cluster in the vSphere Client and select the host.

Answer: B,D,E

Explanation:

The "Ensure Accessibility" option ensures that all data remains accessible during maintenance while minimizing the impact on performance and data migration.

The administrator must navigate to the vSAN cluster in the vSphere Client to select the host for maintenance mode.

Right-clicking the host and selecting "Enter Maintenance Mode" is the standard action for placing a host into maintenance mode.

NEW QUESTION # 137

What is the impact of consolidating snapshots on a virtual machine?

- A. It changes the VM's hardware compatibility settings.
- B. It disconnects the VM from the network temporarily.
- C. It reverts the VM to the state of the first snapshot taken.
- D. It temporarily increases the available disk space consumption on the datastore while merging data.

Answer: D

Explanation:

When consolidating snapshots, the data from the snapshot files is merged back into the original virtual disk. This process temporarily increases the disk space usage on the datastore because of the additional space required to merge the snapshot data into the primary disk.
