## Fortinet NSE 7 - Public Cloud Security 7.6 Architect Sample Questions (Q31-Q36):

### NEW QUESTION # 31

Refer to the exhibit.

What is the purpose of this section of an Azure Bicep file?

- A. To document the FortiOS versions in the resulting topology
- B. To restrict which FortiOS versions are accepted for deployment
- C. To indicate the correct FortiOS upgrade path after deployment
- D. To add a comment with the permitted FortiOS versions that can be deployed

**Answer: B**

### NEW QUESTION # 32

Refer to the exhibit.

An experienced AWS administrator is creating a new virtual public cloud (VPC) flow log with the settings shown in the exhibit. What is the purpose of this configuration?

- A. To troubleshoot a log flow issue
- B. To retain logs for a long term
- C. To maximize the number of logs saved
- D. To monitor logs in real time

**Answer: B**

### NEW QUESTION # 33

Refer to the exhibit. An administrator is trying to deploy a FortiGate VM in Microsoft Azure using Terraform. However, during the configuration, the Azure client secret is no longer visible in the Azure portal.

How would the administrator obtain the Azure client secret to configure on Terraform?

The screenshot shows the Azure portal interface for managing app registrations. The URL in the address bar is 'Home > Default Directory > App registrations > -app | Certificates & secrets'. The left sidebar shows navigation options like Overview, Quickstart, Integration assistant, and various management tabs. The 'Certificates & secrets' tab is currently selected. A modal window provides information about client secrets, stating: 'Application registration certificates, secrets and federated credentials can be found in the tabs below.' Below the modal, the 'Client secrets' tab is active, showing a single entry for 'lab-trble'. The 'Certificates' and 'Federated credentials' tabs are also present. The right side of the screen shows the Fortinet logo and some secret ID text.

- A. Create a new client secret and take note of it.
- B. Create a new Azure account and assign it the Administrator role.
- C. Log in to the Azure CLI as a power user to obtain the client secret.
- D. Use the Terraform output file values to obtain the client secret.

**Answer: A**

Explanation:

In Azure, once a client secret is created, its value is only visible at creation time. If it is no longer visible, the administrator cannot recover it. The correct step is to create a new client secret and securely record it for use with Terraform.

**NEW QUESTION # 34**

Which statement about Transit Gateway (TGW) in Amazon Web Services (AWS) is true?

- A. The TGW default route table cannot be disabled.
- B. **TGW can have multiple TGW route tables.**
- C. Both the TGW attachment and propagation must be in the same TGW route table.
- D. A TGW attachment can be associated with multiple TGW route tables.

**Answer: B**

Explanation:

According to the FortiOS 7.6 AWS Administration Guide and the Fortinet Public Cloud Security 7.4 training materials regarding centralized security inspection:

Multiple Route Tables (Option B): A single AWS Transit Gateway is designed to support multiple TGW route tables. By default, there is a soft limit of 20 route tables per Transit Gateway, which allows administrators to implement sophisticated network segmentation and granular routing policies. In a FortiGate-centric "Security Hub" or "Transit VPC" architecture, multiple route tables are used to separate "Spoke" traffic from "Security" traffic, ensuring all inter-VPC traffic is forced through the FortiGate-VM for inspection.

Associations and Propagations: \* Association: Each individual TGW attachment (VPC, VPN, or Direct Connect) can be associated with exactly one TGW route table at any given time. This table dictates where packets coming from that attachment will be sent. Because of this 1:1 relationship, Option C is incorrect.

Propagation: An attachment can propagate its routes to one or many TGW route tables. This flexibility allows a VPC's prefix to be known in multiple routing domains, meaning that association and propagation do not need to occur in the same table, making Option A incorrect.

Default Route Table Management: When creating an AWS Transit Gateway, the options for "Default route table association" and "Default route table propagation" are enabled by default, but they can be disabled during or after creation. Disabling these is a security best practice when deploying FortiGate-VMs to prevent the TGW from automatically creating a "full-mesh" connectivity that bypasses the firewall, making Option D incorrect.

**NEW QUESTION # 35**

Refer to the exhibit. An experienced AWS administrator is creating a new Virtual Private Cloud (VPC) flow log with the settings shown in the exhibit.

What is the purpose of this configuration?

VPC > Your VPCs > Create flow log

## Create flow log Info

Flow logs can capture IP traffic flow information for the network interfaces associated with your resources. You can create multiple flow logs to send traffic to different destinations.

**Selected resources** Info

Name	Resource ID	State
DefaultVPC	vpc-09d6e4631cd49d2b3	<input checked="" type="checkbox"/> Available

**Flow log settings**

**Name - optional**

**Filter**  
The type of traffic to capture (accepted traffic only, rejected traffic only, or all traffic).

Accept  
 Reject  
 All

**Maximum aggregation interval** Info  
The maximum interval of time during which a flow of packets is captured and aggregated into a flow log record.

10 minutes  
 1 minute

**Destination**  
The destination to which to publish the flow log data.

Send to CloudWatch Logs  
 Send to an Amazon S3 bucket  
 Send to Amazon Data Firehose in the same account  
 Send to Amazon Data Firehose in a different account

- A. To troubleshoot a log flow issue
- **B. To retain logs for a long term**
- C. To maximize the number of logs saved
- D. To monitor logs in real time

**Answer: B**

**Explanation:**

In the exhibit, the destination is set to Amazon S3, which is typically used for long-term storage and retention of VPC flow logs. CloudWatch or Data Firehose would be chosen for real-time monitoring or analysis, but S3 ensures the logs are retained cost-effectively for long durations.
