EXIN EPI Certified Data Centre Specialist Sample Questions (Q33-Q38):

NEW QUESTION # 33

You are installing new copper cabling.

What is the advantage or disadvantage of choosing pre-terminated category 6 or 6A cabling?

- **A. Pre-terminated cabling is already factory tested and saves installation time.**
- B. Pre-terminated cabling has a higher fire rating.
- C. There is no advantage as most new copper cabling network designs are based on category 3 or 5E for horizontal cabling.
- D. Pre-terminated cabling makes ordering of the copper cables more complex, as you need to know in advance on which side the male or female connector needs to be located.

Answer: A

Explanation:

Choosing pre-terminated category 6 or 6A cabling provides several advantages, primarily related to time savings and reliability. Since pre-terminated cables are factory tested, they ensure consistent quality and performance, reducing the need for additional testing during installation. This makes installation faster and more efficient, which can significantly reduce labor costs and deployment times.

Detailed Explanation:

Pre-terminated cabling systems are manufactured and tested in controlled environments, which ensures they meet industry standards for performance. This factory testing process minimizes the likelihood of faults, reducing the need for troubleshooting and retesting on-site. Moreover, pre-terminated solutions can help to streamline installations because they eliminate the need for on-site terminations, which can be time-consuming and require skilled labor.

This is especially beneficial for data centers, where rapid deployment and minimizing potential points of failure are critical to maintaining uptime. However, it is important to note that pre-terminated cables require accurate planning, as lengths and connector configurations must be predetermined.

EPI Data Center Specialist References:

According to EPI Data Center Specialist guidelines, pre-terminated cabling is advantageous in data center environments due to reduced installation time and enhanced reliability from factory testing. These attributes align with best practices for efficient data center management, where maintaining performance and minimizing downtime are priorities.

NEW QUESTION # 34

What is the main advantage of using an End-of-Row (EoR) design?

- A. You need a separate rack to install all your EoR switches
- B. A ToR switch has only optical interfaces
- **C. There will be fewer switches to manage (corrected typing: original said "more")**
- D. A single Top-of-Rack (ToR) switch is more expensive than an EoR switch

Answer: C

Explanation:

EoR centralizes access/aggregation switches at the end of each row, reducing the number of access switches compared with ToR (one per rack), which simplifies management and often lowers Ops costs.

* A, D are incorrect generalizations.

References: ANSI/TIA-942-B §8 (Telecommunications infrastructure-HDA/EoR/ToR discussion); Cisco Data Center Access Layer CVD (EoR vs ToR design considerations).

NEW QUESTION # 35

A data center is in an area where utility power is highly available—only a few outages per year, typically <1 hour per event and <50 hours/year not available. What type of generators should be installed?

- A. Standby generators; no N+1 needed as the risk of a failure to start is negligible
- B. A combination of standby, prime, and continuous sized to 500% of the load
- C. Continuous generators in at least N+1
- **D. Standby generators, ideally in an N+1 configuration**

Answer: D

Explanation:

With infrequent/short outages, Standby (Emergency Standby Power, ESP) generators are appropriate; N+1 mitigates failure-to-start risk and supports concurrently maintainable designs.

References: ISO 8528-1 (generator rating definitions: ESP/PRP/Continuous), ANSI/TIA-942-B §6.2 (electrical redundancy).

NEW QUESTION # 36

What is the main disadvantage of using a ToR (Top of Rack) design?

- A. A ToR (Top of Rack) switch has only optical interfaces.
- B. You need a separate rack to install all your ToR (Top of Rack) switches.
- C. A single ToR (Top of Rack) switch is more expensive than an EoR (End of Row) switch.
- **D. There will be more switches to manage.**

Answer: D

Explanation:

A Top of Rack (ToR) design typically requires more switches because each rack has its own switch to manage network connections, as opposed to End of Row (EoR) or centralized designs, which consolidate switches.

While ToR designs improve cabling efficiency and reduce latency, they also increase the number of switches, thus raising management complexity and potentially increasing capital and operational costs.

Detailed Explanation:

In a ToR setup, each rack's individual switch allows for quick access and streamlined cabling within the rack.

However, this setup means more devices to configure, monitor, and maintain, which can increase administrative overhead and network management complexity.

EPI Data Center Specialist References:

EPI documentation notes that ToR designs can improve performance but also lead to increased management needs due to the higher switch count, making them less ideal in environments where simplified network management is prioritized.

NEW QUESTION # 37

The data center has been in operation for about 1 year and 2 months. The dust levels in the computer room are relatively high. What is the most likely root cause?

- A. Low pressure in the computer room
- B. Every computer room has high dust levels due to constant high-speed air movement
- C. The cleaning crew is not doing their work properly
- **D. Floorboards are most likely not fitted correctly**

Answer: D

Explanation:

High dust levels in a computer room are often due to improperly fitted floorboards. When floorboards are not securely installed or do not fit tightly, they allow dust and particles from the subfloor to enter the room. In a data center, this can lead to high levels of dust that affect air quality and equipment performance.

Detailed Explanation:

Raised floors in data centers can accumulate dust and debris, especially if the floorboards are not properly sealed. Loose or improperly fitted floorboards allow contaminants from the subfloor to enter the data center environment, increasing the dust levels over time. Proper installation and maintenance of floor panels are essential to prevent dust infiltration and maintain clean conditions.

EPI Data Center Specialist References:

EPI training emphasizes proper flooring installation and maintenance to control air quality within data centers. Correctly fitted floorboards prevent dust accumulation from the subfloor, which helps protect sensitive equipment and maintains a cleaner environment.
