305-300 Learning Material: LPIC-3 Exam 305: Virtualization and Containerization & 305-300 Practice Test

If we want to survive in this competitive world, we need a comprehensive development plan to adapt to the requirement of modern enterprises. We sincerely recommend our 305-300 preparation exam for our years' dedication and quality assurance will give you a helping hand on the 305-300 Exam. There are so many advantages of our 305-300 study materials you should spare some time to get to know. Just have a try and you will love our 305-300 exam questions.

Lpi LPIC-3 Exam 305: Virtualization and Containerization Sample Questions (Q30-Q35):

NEW QUESTION # 30

What is the purpose of the command `vagrant init`?

- A. It starts a Vagrant box.
- B. It creates a Vagrant configuration file.
- C. It executes a provisioning tool in a running box.
- D. It installs Vagrant on a Linux host.
- E. It downloads a Vagrant box.

Answer: B

Explanation:

Explanation

The command `vagrant init` is used to initialize the current directory to be a Vagrant environment by creating an initial `Vagrantfile` if one does not already exist¹. The `Vagrantfile` contains the configuration settings for the Vagrant box, such as the box name, box URL, network settings, synced folders, provisioners, etc. The command `vagrant init` does not execute any provisioning tool, start any box, install Vagrant on a Linux host, or download any box. Those actions are performed by other Vagrant commands, such as `vagrant provision`, `vagrant up`, `vagrant install`, and `vagrant box add`, respectively. References:

NEW QUESTION # 31

Which of the following statements are true regarding a Pod in Kubernetes? (Choose two.)

- A. `systemd` is used to manage individual Pods on the Kubernetes nodes.
- B. When a Pod fails, Kubernetes restarts the Pod on another node by default.
- C. All containers of a Pod run on the same node.
- D. A Pod is the smallest unit of workload Kubernetes can run.
- E. Pods are always created automatically and cannot be explicitly configured.

Answer: C,D

NEW QUESTION # 32

Which of the following commands lists all differences between the disk images `vml-snap.img` and `vml.img`?

- A. `virt-diff -a vml-snap.img -A vml.img`
- B. `virt-delta -a vml-snap.img -A vml.img`
- C. `virt-cp-in -a vml-snap.img -A vml.img`
- D. `virt-history -a vml-snap.img -A vml.img`
- E. `virt-cmp -a vml-snap.img -A vml.img`

Answer: A

NEW QUESTION # 33

When setting up a KVM virtualization host, which one of the following components is NOT required?

- A. `bridgeutils`
- B. `virsh`
- C. `qemu`
- D. `libvirt`
- E. `kvm kernel modules`

Answer: B

Explanation:

When configuring a KVM-based virtualization host, several core components are mandatory to enable and manage virtual machines. According to KVM and virtualization documentation, KVM kernel modules are essential because they provide hardware-assisted virtualization support within the Linux kernel. QEMU is required to perform hardware emulation and manage virtual machine execution. Libvirt acts as the virtualization management API, enabling centralized and secure control of virtual machines. Additionally, bridgeutils is commonly required to configure network bridges, allowing virtual machines to communicate with external networks. However, virsh is not strictly required. Virsh is a command-line utility that interacts with libvirt to manage virtual machines, but it is only a management interface, not a core dependency. Virtual machines can still be created and managed using alternative tools such as virt-manager, Ansible, OpenStack, or custom API-based solutions without virsh being installed. Virtualization documentation clearly distinguishes between essential backend components (KVM, QEMU, libvirt) and optional management tools (virsh). Therefore, while virsh is widely used and highly recommended for administrative convenience, it is not a mandatory component for a functional KVM virtualization host.

NEW QUESTION # 34

Which of the following KVM parameters is identical to the KVM parameter `-hdb file.img`?

- A. -drive bus=hd, busid=b, src=file.img
- B. -drive bus=ide1, type=slave, image=file.img
- C. -drive file=file.img, index=1, media=disk, if=ide
- D. -drive image=file.img, if=ide, device=hdb
- E. -drive type=loop, src=file.img, dst=disk:hdb

Answer: C

Explanation:

In QEMU/KVM, the legacy parameter -hdb file.img attaches a disk image as the primary IDE slave device.

According to QEMU documentation, this corresponds to an IDE device with index 1, media type disk, and interface IDE.

The modern equivalent using the -drive syntax is:

-drive file=file.img, index=1, media=disk, if=ide

Option D matches this mapping precisely. The other options use invalid or unsupported parameter combinations and do not correctly represent the IDE device mapping.

Therefore, the correct answer is D.
