- **CRISC Exam Study Guide by Hemang Doshi**

Last but not the least, this study material will exceed all of your expectations. Out of all the resources, this one is the most currently updated, which is by the way, available on Amazon. Besides, it is also perfectly aligned with the topics covered in the CRISC Review Manual. For technical and non-technical candidates alike, Hemang Doshi's guide will allow you to gain a wider comprehension of risk management features. In addition, you will quickly learn through his uncomplicated way of explaining the ISACA framework. Simply say, his work consists of well-explained ideas that give a little peek at his 15 years of professional experience. This author is brilliant in the fields of risk management, third-party risk management, information security audit, and internal audit so reading his study guide will definitely make you ready to succeed in the CRISC exam.

- **CRISC Certified in Risk and Information Systems Control All-in-One Exam Guide 1st Edition**

Authored by **Bobby Rogers and Dawn Dunkerley**, two prominent figures in their field, this exam guide was masterfully made with practical frameworks and reference topics. As most of its buyers proclaimed, this book in Kindle format surpasses the well-organized niche of the ISACA review manual itself. The structure of its ideas is way better to learn from compared to the aforementioned. Because of its smooth readability, it's been dubbed as one of those books that don't demand to be read over and over again. This 1st Edition details the knowledge required in having a brilliant score on the CRISC test. In addition, it also includes electronic full-length features that can be downloaded and customizable practice tests questions alongside the Total Tester engine.

ISACA Certified in Risk and Information Systems Control Sample Questions (Q289-Q294):

NEW QUESTION # 289

What can be determined from the risk scenario chart?

- A. The multiple risk factors addressed by a chosen response
- B. Capability of enterprise to implement
- C. Risk treatment options
- **D. Relative positions on the risk map**

Answer: D

Explanation:

The risk scenario chart shows the initial and residual risk ratings, and the project cost, for four projects named Sierra, Tango, Uniform, and Victor. The initial risk rating is the level of risk before applying any controls or mitigation measures, while the residual risk rating is the level of risk after applying the controls or measures.

The project cost is the amount of resources required to implement the project. These three factors can be used to determine the relative positions of the projects on a risk map, which is a graphical tool for displaying the risks based on their impact and likelihood. The risk map can help to prioritize and compare the risks, and to select the most appropriate risk response strategy. The other options are not the best answers, as they are not directly shown or derived from the risk scenario chart. The risk treatment options are the possible actions that can be taken to address the risks, such as accept, avoid, mitigate, or transfer. The capability of enterprise to implement is the ability of the organization to execute the risk response plan, considering the available resources, skills, and constraints. The multiple risk factors addressed by a chosen response are the various elements that contribute to or affect the risk, such as the threat sources, events, vulnerabilities, assets, and impacts. These factors are not explicitly stated or measured in the risk scenario chart, and may require further analysis or information. References = How to Write Strong Risk Scenarios and

NEW QUESTION # 291

You are the project manager of HJT project. You want to measure the operational effectiveness of risk management capabilities. Which of the following is the BEST option to measure the operational effectiveness?

- A. Explanation:
Key performance indicators are a set of quantifiable measures that a company or industry uses to gauge or compare performance in terms of meeting their strategic and operational goals. Key performance indicators (KPIs) provide insights into the operational effectiveness of the concept or capability that they monitor.
- B. Key risk indicators
- C. Capability maturity models
- **D. Key performance indicators**
- E. Metric thresholds

Answer: D

Explanation:

is incorrect. Key risk Indicators (KRIs) only provide insights into potential risks that may exist or be realized within a concept or capability that they monitor. Answer:B is incorrect. Capability maturity models (CMMs) assess the maturity of a concept or capability and do not provide insights into operational effectiveness. Answer:D is incorrect. Metric thresholds are decision or action points that are enacted when a KPI or KRI reports a specific value or set of values.

NEW QUESTION # 292

Which of the following is the MOST important consideration when identifying stakeholders to review risk scenarios developed by a risk analyst? The reviewers are:

- A. members of senior management.
- B. independent from the business operations.
- **C. accountable for the affected processes.**
- D. authorized to select risk mitigation options.

Answer: C

Explanation:

The most important consideration when identifying stakeholders to review risk scenarios developed by a risk analyst is that the reviewers are accountable for the affected processes. This is because the reviewers need to have a clear understanding of the business processes that are exposed to the risks, and the potential impact and consequences of the risk scenarios. The reviewers also need to have the authority and responsibility to implement the risk responses and monitor the risk performance. By involving the stakeholders who are accountable for the affected processes, the risk analyst can ensure that the risk scenarios are realistic, relevant, and comprehensive, and that the risk management process is aligned with the business objectives and expectations. The other options are not as important as the accountability for the affected processes, because they do not guarantee that the reviewers have the necessary knowledge, experience, and involvement in the

risk management process, as explained below:

B: Members of senior management are not the most important consideration, because they may not have the detailed or operational knowledge of the business processes that are exposed to the risks, or the technical or practical aspects of the risk scenarios. Senior management may also have different or conflicting priorities or perspectives on the risk management process, which may affect the quality and validity of the review.

C: Authorized to select risk mitigation options are not the most important consideration, because they may not have the direct or regular involvement in the business processes that are exposed to the risks, or the specific or contextual understanding of the risk scenarios. The authority to select risk mitigation options may also depend on other factors, such as the risk appetite, the budget, or the organizational structure, which may limit or influence the review.

D: Independent from the business operations are not the most important consideration, because they may not have the sufficient or relevant knowledge of the business processes that are exposed to the risks, or the potential or actual impact and consequences of the risk scenarios. The independence from the business operations may also create a gap or disconnect between the risk management process and the business objectives and expectations, which may affect the effectiveness and efficiency of the review. NEW QUESTION # 293

Which of the following is the GREATEST advantage of implementing a risk management program?

- A. Improving security governance
- B. Promoting a risk-aware culture
- C. Reducing residual risk
- D. Enabling risk-aware decisions

Answer: D

Explanation:

A risk management program is a systematic and structured approach to identify, analyze, evaluate, treat, monitor, and communicate the risks that may affect the organization's objectives and performance.

The greatest advantage of implementing a risk management program is enabling risk-aware decisions. This means that the organization incorporates the risk information and analysis into its decision making process, such as strategic planning, resource allocation, project management, etc.

Enabling risk-aware decisions helps to optimize the outcomes and benefits of the decisions, balance the opportunities and threats of the decisions, and align the decisions with the organization's risk appetite and tolerance.

The other options are not the greatest advantages of implementing a risk management program. They are either secondary or not essential for risk management.
