## 2026 High Pass-Rate Salesforce Exam Dumps Identity-and-Access-Management-Architect Free

These are Salesforce Identity-and-Access-Management-Architect desktop software and web-based. As the name suggests, desktop Salesforce Identity-and-Access-Management-Architect practice exam software works offline on Windows computers and you need an active internet connection to operate the Salesforce Identity-and-Access-Management-Architect web-based practice test. Both Identity-and-Access-Management-Architect practice exams mimic the Salesforce Identity-and-Access-Management-Architect actual test, identify your mistakes, offer customizable Identity-and-Access-Management-Architect mock tests, and help you overcome mistakes.

Salesforce Identity-and-Access-Management-Architect (IAM) certification exam is designed for professionals who want to demonstrate their expertise in designing and implementing secure identity and access management solutions using Salesforce. Salesforce Certified Identity and Access Management Architect certification is intended for individuals who are responsible for designing and implementing secure identity and access management solutions for Salesforce customers.

## Salesforce Certified Identity and Access Management Architect Sample Questions (Q187-Q192):

### NEW QUESTION # 187

A service provider (SP) supports both Security Assertion Markup Language (SAML) and OpenID Connect (OIDC).

When integrating this SP with Salesforce, which use case is the determining factor when choosing OIDC or SAML?

- A. OIDC is more secure than SAML and therefore is the obvious choice.
- **B. The SP needs to perform API calls back to Salesforce on behalf of the user after the user logs in to the service provider.**
- C. They are equivalent protocols and there is no real reason to choose one over the other.
- D. If the user has a session on Salesforce, you do not want them to be prompted for a username and password when they login to the SP.

**Answer: B**

#### NEW QUESTION # 188

After a recent audit, universal containers was advised to implement Two-factor Authentication for all of their critical systems, including salesforce. Which two actions should UC consider to meet this requirement?

Choose 2 answers

- **A. Require users to provide their RSA token along with their credentials.**
- B. Require users to supply their email and phone number, which gets validated.
- C. Require users to enter a second password after the first Authentication
- **D. Require users to use a biometric reader as well as their password**

**Answer: A,D**

Explanation:

Explanation

A is correct because requiring users to provide their RSA token along with their credentials is a form of two-factor authentication.

An RSA token is a hardware device that generates a one-time password (OTP) that changes every few seconds. The user needs to enter both their password and the OTP to log in to Salesforce.

D is correct because requiring users to use a biometric reader as well as their password is another form of two-factor authentication.

A biometric reader is a device that scans a user's fingerprint, face, iris, or other physical characteristics to verify their identity. The user needs to provide both their password and their biometric data to log in to Salesforce.

B is incorrect because requiring users to supply their email and phone number, which gets validated, is not a form of two-factor authentication. This is a form of identity verification, which is used to confirm that the user owns the email and phone number they provided. However, this does not add an extra layer of protection beyond their password when they log in to Salesforce.

C is incorrect because requiring users to enter a second password after the first authentication is not a form of two-factor authentication. This is a form of single-factor authentication, which only relies on something the user knows (their passwords). This does not increase security against unauthorized account access.

#### NEW QUESTION # 189

A division of a Northern Trail Outfitters (NTO) purchased Salesforce. NTO uses a third party identity provider (IdP) to validate user credentials against Its corporate Lightweight Directory Access Protocol (LDAP) directory. NTO wants to help employees remember as passwords as possible.

What should an identity architect recommend?

- **A. Setup Salesforce as a Service Provider to the existing IdP.**
- B. Use Salesforce connect to synchronize LDAP passwords to Salesforce.
- C. Setup Salesforce as an Authentication Provider to the existing IdP.
- D. Setup Salesforce as an IdP to authenticate against the LDAP directory.

**Answer: A**

Explanation:

To help employees remember fewer passwords, an identity architect should recommend setting up Salesforce as a service provider (SP) to the existing IdP. A SP is the system that relies on the IdP for authentication and provides access to its services based on the SAML assertions from the IdP. To set up Salesforce as a SP, you need to create a connected app for Salesforce in the IdP, enable SAML and configure the SAML settings, such as the entity ID, ACS URL, and subject type. You also need to enable SSO for your Salesforce org, upload the IdP certificate, and configure the SSO settings, such as the issuer, identity type, and service provider

initiated request binding.

### NEW QUESTION # 190

Universal Containers (UC) is considering a Customer 360 initiative to gain a single source of the truth for its customer data across disparate systems and services. UC wants to understand the primary benefits of Customer 360 Identity and how it contributes to a successful Customer 360 Truth project.

What are two key benefits of Customer 360 Identity as it relates to Customer 360?

Choose 2 answers

- A. Customer 360 Identity automatically integrates with Customer 360 Data Manager and Customer 360 Audiences to seamlessly populate all user data.
- B. Customer 360 Identity enables an organization to build a single login for each of its customers, giving the organization an understanding of the user's login activity across all its digital properties and applications.
- C. Customer 360 Identity not only provides a unified sign up and sign in experience, but also tracks anonymous user activity prior to signing up so organizations can understand user activity before and after the users identify themselves.
- D. Customer 360 Identity supports multiple brands so you can deliver centralized identity services and correlation of user activity, even if it spans multiple corporate brands and user experiences.

**Answer: B,D**

Explanation:

Explanation

Customer 360 Identity is a cloud-based identity service that provides a single, trusted identity for customers across all your digital properties and applications<sup>2</sup>. Customer 360 Identity has several benefits that relate to Customer 360, such as<sup>3</sup>:

Customer 360 Identity enables an organization to build a single login for each of its customers, giving the organization an understanding of the user's login activity across all its digital properties and applications. This helps to create a unified customer profile and deliver personalized experiences based on user preferences and behaviors<sup>3</sup>.

Customer 360 Identity supports multiple brands so you can deliver centralized identity services and correlation of user activity, even if it spans multiple corporate brands and user experiences. This helps to maintain brand consistency and loyalty while providing seamless access to your products and services<sup>3</sup>.

### NEW QUESTION # 191

Universal Containers (UC) uses a home-grown Employee portal for their employees to collaborate. UC decides to use Salesforce Ideas to allow employees to post Ideas from the Employee portal. When users click on some of the links in the Employee portal, the users should be redirected to Salesforce, authenticated, and presented with the relevant pages. What OAuth flow is best suited for this scenario?

- A. Web Application flow
- B. User-Agent flow
- C. Web Server flow
- D. SAML Bearer Assertion flow

**Answer: C**

Explanation:

Explanation

The best OAuth flow for this scenario is the web server flow. The web server flow is an OAuth authorization flow that allows a web application, such as UC's employee portal, to obtain an access token and a refresh token from Salesforce after the user grants permission. The web application can then use the access token to access Salesforce data and features, such as posting ideas, and use the refresh token to obtain a new access token when the previous one expires or becomes invalid. This flow is suitable for UC's scenario because it allows users to be redirected to Salesforce, authenticated, and presented with the relevant pages when they click on some of the links in the employee portal. This flow also provides a secure and seamless user experience by using a confidential

client secret that is stored on the web server and not exposed to the browser.

The other options are not valid OAuth flows for this scenario. The web application flow is not a standard term for OAuth, but it could refer to the user-agent flow, which is an OAuth authorization flow that allows a browser or web-view, such as a mobile app or a desktop app, to obtain an access token from Salesforce by using a script or a pop-up window. This flow is not suitable for UC's scenario, as it does not use a web server or a client secret, and it does not provide a refresh token. The SAML bearer assertion flow is an OAuth authorization flow that allows an external application to obtain an access token from Salesforce by using a SAML assertion from an identity provider (IdP) that verifies the user's identity. This flow is not suitable for UC's scenario, as it does not involve user interaction or redirection to Salesforce. The user-agent flow is an OAuth authorization flow that allows a browser or web-view, such as a mobile app or a desktop app, to obtain an access token from Salesforce by using a script or a pop-up window. This flow is not suitable for UC's scenario, as it does not use a web server or a client secret, and it does not provide a refresh token. References:
