These HashiCorp Certified: Terraform Associate (003) (HCTA0-003) (Terraform-Associate-003) practice exams simulate the actual Terraform-Associate-003 exam conditions and provide an accurate assessment of test preparation.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q73-Q78):

NEW QUESTION # 73

Terraform installs its providers during which phase?

- **A. Init**
- B. All of the above
- C. Plan
- D. Refresh

Answer: A

Explanation:

Terraform installs providers during the terraform init phase.

* Providers are downloaded and installed when running terraform init.

* A (terraform plan) is incorrect because terraform plan only calculates changes but does not install providers.

* C (terraform refresh) is incorrect because terraform refresh only updates the state but does not install providers.

Official Terraform Documentation Reference:

Provider Installation - HashiCorp Documentation

NEW QUESTION # 74

Once you configure a new Terraform backend with a terraform code block, which command(s) should you use to migrate the state file?

- A. terraform init
- **B. terraform destroy, then terraform apply**
- C. terraform apply
- D. terraform push

Answer: B

Explanation:

Explanation

This command will initialize the new backend and prompt you to migrate the existing state file to the new location. The other commands are not relevant for this task.

NEW QUESTION # 75

You want to use API tokens and other secrets within your team's Terraform workspaces.

Where does HashiCorp recommend you store these sensitive values? (Pick the 3 correct responses)

- **A. In HashiCorp Vault.**
- B. In a terraform.tfvars file, checked into your version control system.
- C. In a plaintext document on a shared drive.
- **D. In an HCP Terraform/Terraform Cloud variable, with the sensitive option checked.**
- **E. In a terraform.tfvars file, securely managed and shared with your team.**

Answer: A,D,E

Explanation:

Sensitive values such as API tokens should be stored in a secure way, either in Terraform Cloud variables marked as sensitive or in HashiCorp Vault. Storing secrets in version control systems or plaintext files is not recommended.

NEW QUESTION # 76

A developer on your team is going to leave down an existing deployment managed by Terraform and deploy a new one. However, there is a server resource named `aws_instance.ubuntu[1]` they would like to keep. What command should they use to tell Terraform to stop managing that specific resource?

- A. Terraform apply `rmaws_instance.ubuntu[1]`

- B. Terraform destroy rmaws_instance.ubuntu[1]
- C. Terraform plan rmaws_instance.ubuntu[1]
- D. Terraform state rmaws_instance.ubuntu[1]

Answer: D

Explanation:

Explanation

To tell Terraform to stop managing a specific resource without destroying it, you can use the terraform state rm command. This command will remove the resource from the Terraform state, which means that Terraform will no longer track or update the corresponding remote object. However, the object will still exist in the remote system and you can later use terraform import to start managing it again in a different configuration or workspace. The syntax for this command is terraform state rm <address>, where <address> is the resource address that identifies the resource instance to remove. For example, terraform state rm aws_instance.ubuntu[1] will remove the second instance of the aws_instance resource named ubuntu from the state. References = : Command: state rm : Moving Resources

NEW QUESTION # 77

Only the user that generated a terraform plan may apply it.

- A. False
- B. True

Answer: A

Explanation:

Detailed Explanation:

* Rationale for Correct Answer (False): Any user with access to the saved plan file (terraform plan - out=planfile) can run terraform apply planfile. Terraform does not enforce user-specific restrictions.

* Analysis of Incorrect Option:

* True: Incorrect - Terraform doesn't tie plan files to individual users.

* Key Concept: Plan files ensure predictability but are not bound to the identity of the user.
