CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q423-Q428):

NEW QUESTION # 423
A cybersecurity analyst needs to harden a server that is currently being used as a web server.
The server needs to be accessible when entering www.company.com into the browser.
Additionally, web pages require frequent updates, which are performed by a remote contractor.
Given the following output:
Which of the following should the cybersecurity analyst recommend to harden the server?
(Choose two.)

- A. Change the server's IP to a private IP address
- B. Perform a vulnerability scan
- C. Block port 80 with the host-based firewall
- D. Uninstall the DNS service
- E. Change the SSH port to a non-standard port
- F. Disable the Telnet service

Answer: D,F

Explanation:
You don't need DNS running on a web server. Other servers will provide the entries for that server to be found.

NEW QUESTION # 424
A team of analysts is developing a new internal system that correlates information from a variety of sources, analyzes that information, and then triggers notifications according to company policy.
Which of the following technologies was deployed?

- A. SOAR
- B. CERT
- C. SIEM
- D. IPS

Answer: C

NEW QUESTION # 425
When undertaking a cloud migration of multiple SaaS applications, an organization's systems administrators struggled with the complexity of extending identity and access management to cloud-based assets. Which of the following service models would have reduced the complexity of this project?

- A. SWG
- B. CASB
- C. SASE
- D. ZTNA

Answer: B

Explanation:

A Cloud Access Security Broker (CASB) would have reduced the complexity of identity and access management in cloud-based assets. CASBs provide visibility into cloud application usage, data protection, and governance for cloud-based services.

NEW QUESTION # 426

A security manager is looking at a third-party vulnerability metric (SMITTEN) to improve upon the company's current method that relies on CVSSv3. Given the following:

Which of the following vulnerabilities should be prioritized?

- A. Vulnerability 4
- B. Vulnerability 1
- C. Vulnerability 3
- D. Vulnerability 2

Answer: D

Explanation:
Vulnerability 2 should be prioritized as it is exploitable, has high exploit activity, and is exposed externally according to the SMITTEN metric.

NEW QUESTION # 427

A security analyst has prepared a vulnerability scan that contains all of the company's functional subnets.
During the initial scan, users reported that network printers began to print pages that contained unreadable text and icons.
Which of the following should the analyst do to ensure this behavior does not oocur during subsequent vulnerability scans?

- A. Ignore embedded web server ports.
- B. Create a tailored scan for the printer subnet.
- C. Increase the threshold length of the scan timeout.
- D. Perform non-credentialed scans.

Answer: B

Explanation:
The best way to prevent network printers from printing pages during a vulnerability scan is to create a tailored scan for the printer subnet that excludes the ports and services that trigger the printing behavior. The other options are not effective for this purpose: performing non-credentialed scans may not reduce the impact on the printers; ignoring embedded web server ports may not cover all the possible ports that cause printing; increasing the threshold length of the scan timeout may not prevent the printing from occurring.
References: According to the CompTIA CySA+ Study Guide: Exam CS0-003, 3rd Edition1, one of the objectives for the exam is to "use appropriate tools and methods to manage, prioritize and respond to attacks and vulnerabilities". The book also covers the usage and syntax of vulnerability scanning tools, such as Nessus, Nmap, and Qualys, in chapter 4. Specifically, it explains the meaning and function of each component in vulnerability scanning, such as credentialed vs. non-credentialed scans, port scanning, and scan scheduling1, pages 149-160. It also discusses the common issues and challenges of vulnerability scanning, such as network disruptions, false positives, and scan scope1, pages 161-162. Therefore, this is a reliable source to verify the answer to the question.
