Pass Guaranteed 2026 Microsoft First-grade AZ-400: Test Designing and Implementing Microsoft DevOps Solutions Centres

Only 20-30 hours are needed for you to learn and prepare our AZ-400 test questions for the exam and you will save your time and energy. No matter you are the students or the in-service staff you are busy in your school learning, your jobs or other important things and can't spare much time to learn. But you buy our AZ-400 Exam Materials you will save your time and energy and focus your attention mainly on your most important thing. And you can master the most important AZ-400 exam torrent in the shortest time and finally pass the AZ-400 exam successfully with our excellent AZ-400 learning prep.

Microsoft Designing and Implementing Microsoft DevOps Solutions Sample

Questions (Q483-Q488):

NEW QUESTION # 483

Your company uses Git as a source code control system for a complex app named App1.

You plan to add a new functionality to App1.

You need to design a branching model for the new functionality.

Which branch lifetime and branch type should you use in the branching model? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

□ Explanation

□ Branch lifetime: Short-lived

□ Branch type: Feature

Feature branches are used when developing a new feature or enhancement which has the potential of a development lifespan longer than a single deployment. When starting development, the deployment in which this feature will be released may not be known. No matter when the feature branch will be finished, it will always be merged back into the master branch.

NEW QUESTION # 484

You are designing a configuration management solution to support five apps hosted on Azure App Service.

Each app is available in the following three environments: development, test, and production.

You need to recommend a configuration management solution that meets the following requirements:

- * Supports feature flags
- * Tracks configuration changes from the past 30 days
- * Stores hierarchically structured configuration values
- * Controls access to the configurations by using role-based access control (RBAC) permission
- * Stores shared values as key/value pairs that can be used by all the apps

Which Azure service should you recommend as the configuration management solution?

- **A. Azure App Configuration**
- B. Azure App Service
- C. Azure Cosmos DB
- D. Azure Key Vault

Answer: A

Explanation:

The Feature Manager in the Azure portal for App Configuration provides a UI for creating and managing the feature flags that you use in your applications.

App Configuration offers the following benefits:

- * A fully managed service that can be set up in minutes
- * Flexible key representations and mappings
- * Tagging with labels
- * Point-in-time replay of settings
- * Dedicated UI for feature flag management
- * Comparison of two sets of configurations on custom-defined dimensions
- * Enhanced security through Azure-managed identities
- * Encryption of sensitive information at rest and in transit
- * Native integration with popular frameworks

App Configuration complements Azure Key Vault, which is used to store application secrets.

NEW QUESTION # 485

Which package feed access levels should be assigned to the Developers and Team Leaders groups for the investment planning applications suite? To answer, drag the appropriate access levels to the correct groups. Each access level may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

□ Explanation

□ Box 1: Reader

Members of a group named Developers must be able to install packages.

Feeds have four levels of access: Owners, Contributors, Collaborators, and Readers. Owners can add any type of identity- individuals, teams, and groups- to any access level.

□ Box 2: Owner

Members of a group named Team Leaders must be able to create new packages and edit the permissions of package feeds.

NEW QUESTION # 486

You manage build and release pipelines by using Azure DevOps. Your entire managed environment resides in Azure.

You need to configure a service endpoint for accessing Azure Key Vault secrets. The solution must meet the following requirements:

Ensure that the secrets are retrieved by Azure DevOps.

Avoid persisting credentials and tokens in Azure DevOps.

How should you configure the service endpoint? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

□ Explanation:

□ Box 1: Azure Pipelines service connection

□ Box 2: Managed Service Identity Authentication

The managed identities for Azure resources feature in Azure Active Directory (Azure AD) provides Azure services with an automatically managed identity in Azure AD. You can use the identity to authenticate to any service that supports Azure AD authentication, including Key Vault, without any credentials in your code.

NEW QUESTION # 487

You are creating a NuGet package.

You plan to distribute the package to your development team privately.

You need to share the package and test that the package can be consumed.

Which four actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Answer:

Explanation:

□ 1 - Configure a self-hosted agent.

□ 2 - Create a new Azure Artifacts feed.

□ 3 - Publish a package.

□ 4 - Connect to an Azure Artifacts feed.
