Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q532-Q537):

NEW QUESTION # 532

A company is deploying an application that processes streaming data in near-real time. The company plans to use Amazon EC2 instances for the workload. The network architecture must be configurable to provide the lowest possible latency between nodes. Which combination of network solutions will meet these requirements? (Choose two.)

- A. Use Amazon Elastic Block Store (Amazon EBS) optimized instance types.
- **B. Run the EC2 instances in a cluster placement group.**
- C. Group the EC2 instances in separate accounts.
- D. Enable and configure enhanced networking on each EC2 instance.
- **E. Attach multiple elastic network interfaces to each EC2 instance.**

Answer: B,E

NEW QUESTION # 533

A payment processing company records all voice communication with its customers and stores the audio files in an Amazon S3 bucket. The company needs to capture the text from the audio files. The company must remove from the text any personally identifiable information (PII) that belongs to customers.

What should a solutions architect do to meet these requirements?

- **A. Configure an Amazon Transcribe transcription job with PII redaction turned on. When an audio file is uploaded to the S3 bucket, invoke an AWS Lambda function to start the transcription job. Store the output in a separate S3 bucket.**
- B. Process the audio files by using Amazon Kinesis Video Streams. Use an AWS Lambda function to scan for known PII patterns.
- C. Create an Amazon Connect contact flow that ingests the audio files with transcription turned on. Embed an AWS Lambda

function to scan for known PII patterns. Use Amazon EventBridge (Amazon CloudWatch Events) to start the contact flow when an audio file is uploaded to the S3 bucket.

- D. When an audio file is uploaded to the S3 bucket, invoke an AWS Lambda function to start an Amazon Textract task to analyze the call recordings.

Answer: A

Explanation:

Explanation

"Sensitive data redaction replaces personally identifiable information (PII) in the text transcript and the audio file. A redacted transcript replaces the original text with [PII]; a redacted audio file replaces spoken personal information with silence. This parameter is useful for protecting customer information."

- A. EC2 Addresses
- B. None of these
- C. Both A and B
- D. VPC Addresses

Answer: A

Explanation:

Stopping an instance

EC2-Classic

If you stop an instance, its Elastic IP address is disassociated, and you must reassociate the Elastic IP address when you restart the instance.

EC2-VPC

If you stop an instance, its Elastic IP address remains associated.

NEW QUESTION # 535

A company is using Amazon S3 for backups from an on-premises environment. Regulatory requirements state that data must be retained for at least 7 years. The data is infrequently accessed for 35 days, but needs to be instantly available. After 35 days, the data is rarely accessed.

Which combination of actions will provide the MOST cost-effective solution? (Select TWO)

- A. Change the backup so the data goes to Amazon S3 Standard-Infrequent Access (S3 Standard-IA) directly
- B. Create an S3 lifecycle policy that moves the data to the GLACIER storage class after 35 days
- C. Create an S3 lifecycle policy that moves the data to Amazon S3 Standard Infrequent Access (S3 Standard-IA) after 35 days
- D. Change the backup so the data goes to Amazon Glacier directly
- E. Create an S3 lifecycle policy that moves the data to the GLACIER storage class after 7 years.

Answer: A,C

NEW QUESTION # 536

A company creates operations data and stores the data in an Amazon S3 bucket for the company's annual audit. An external consultant needs to access an annual report that is stored in the S3 bucket. The external consultant needs to access the report for 7 days.

The company must implement a solution to allow the external consultant access to only the report.

Which solution will meet these requirements with the MOST operational efficiency?

- A. Create a new IAM user that has access to the report in the S3 bucket. Provide the access keys to the external consultant. Revoke the access keys after 7 days.
- **B. Generate a presigned URL that has the required access to the location of the report on the S3 bucket. Share the presigned URL with the external consultant.**
- C. Enable public access to the S3 bucket for 7 days. Remove access to the S3 bucket when the external consultant completes the audit.
- D. Create a new S3 bucket that is configured to host a public static website. Migrate the operations data to the new S3 bucket. Share the S3 website URL with the external consultant.

Answer: B

Explanation:

A presigned URL allows temporary access to a specific object in an S3 bucket without needing to make the bucket public or creating and managing additional IAM users. The URL is time-limited, and permissions are granted only to the specific object (in this case, the annual report), making it a highly secure and operationally efficient solution.

With a presigned URL, the consultant can access the report for the specified duration (7 days), after which the URL will expire automatically, removing the need for manual intervention to revoke access.

AWS References:

Amazon S3 Presigned URLs explain how to generate a presigned URL to grant temporary access to S3 objects.

Best Practices for S3 Security emphasize using presigned URLs for sharing temporary access to S3 objects securely.

Why the other options are incorrect:

A). Public static website: This approach involves making the S3 bucket publicly accessible, which is unnecessary and insecure for sensitive data.

B). Enable public access: Granting public access to the entire bucket, even temporarily, is a security risk and violates best practices.

C). Create an IAM user: Creating an IAM user and managing credentials is unnecessary overhead and less secure compared to a presigned URL for this short-term need.
