## Fortinet FCP - Google Cloud Security 7.6 Administrator Sample Questions (Q30-Q35):

NEW QUESTION # 30

Your organization is deciding between deploying FortiGate active-passive high-availability (HA) in Google Cloud using either the software-defined network (SDN) connector or load balancers.

What two reasons should your organization choose the SDN connector over the load balancer deployment? (Choose two.)

- A. The SDN connector supports multizone failover.
- B. Cost is lower.
- C. Failovers are faster because of to API calls.
- D. There is less administrative overhead.

**Answer: B,D**

Explanation:

Using the SDN connector avoids additional load balancer costs, making it more cost-effective.

The SDN connector enables multizone failover by directly managing network routing, which load balancers do not inherently support.

### NEW QUESTION # 31

For what three reasons must you deploy a set of Google Cloud passthrough network load balancers for an active-passive high-availability (HA) FortiGate cluster instead of a set of Google Cloud proxy network load balancers? (Choose three.)

- A. Passthrough network load balancers can forward all protocols.
- B. Passthrough network load balancers rely on API calls from FortiGate devices during HA failovers.
- C. Passthrough network load balancers terminate SSL connections.
- D. Passthrough network load balancers support health checks.
- E. Passthrough network load balancers offer the highest throughput.

**Answer: A,D,E**

Explanation:

Passthrough load balancers support health checks to monitor backend health for failover.

They can forward all protocols, not limited to HTTP/HTTPS like proxy load balancers.

Passthrough load balancers provide higher throughput because they don't terminate sessions.

### NEW QUESTION # 32

Refer to the exhibit.

```
Google Cloud Fabric Connector

FortiGate-VM64-GCP # gcpd: add GCP Lab
gcpd sdn connector GCP Lab prepare to update
gcpd get token
gcpd metadata url: http://169.254.169.254/computeMetadata/v1/instance/service-accounts/default/token
gcpd metadata result:200
Token expires in: 3599 seconds
gcpd metadata url: http://169.254.169.254/computeMetadata/v1/project/project-id
gcpd metadata result:200
gcpd got project id from metadata: fcp-fcss-course-development
gcpd sdn connector GCP Lab start updating
gcpd sdn connector GCP Lab got empty project list, trying sdn update from metadata project: fcp-fcss-course-development
gcpd sdn connector GCP Lab got instance list successfully
gcpd didn't find any GKE cluster for project fcp-fcss-course-development
gcpd sdn connector GCP Lab list GKE cluster failed
GCP Lab got 3 addresses
gcpd sdn connector GCP Lab start updating IP addresses
gcpd sdn connector GCP Lab finish updating IP addresses
```

An administrator configured GoogleCloud as an external fabric connector on FortiGate.

Which conclusion can you draw from the output?

- A. The external fabric connector found multiple IP addresses assigned to Google Cloud instances.
- B. The external fabric connector shows that an administrator created three dynamic firewall addresses.
- C. The external fabric connector is unable to find a valid Google Cloud project.
- D. The external fabric connector is misconfigured.

**Answer: A**

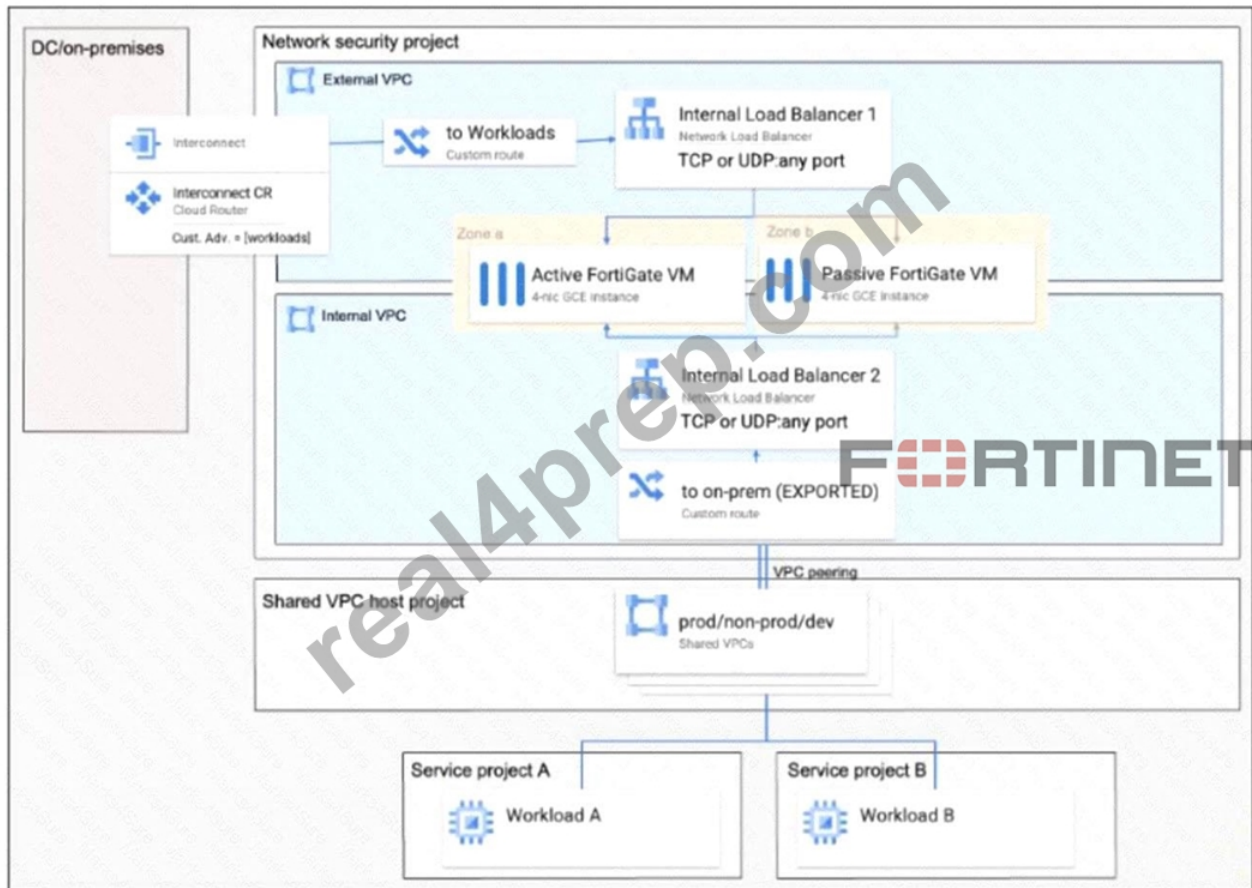

Explanation:

The output shows the connector successfully retrieved project information and instance IP addresses (GCP Lab got 3 addresses), indicating it found multiple IPs assigned to Google Cloud instances.

### NEW QUESTION # 33

Refer to the exhibit.

#### Hybrid cloud environment

In this hybrid environment, in which two ways does the traffic flow from a network node in the on-premises network to Workload B in Google Cloud? (Choose two.)

- A. Traffic will be routed using VPC peering from the Internal VPC to the destination subnet.
- B. Once the traffic has been inspected, the active FortiGate uses VPC peering to forward the traffic to the Server project A VPC.
- C. Traffic will not reach the FortiGate devices because both load balancers are internal.
- D. When the packet reaches the external VPC, it is forwarded to the active FortiGate cluster member using a custom static route.

**Answer: A,D**

Explanation:

Traffic from on-premises enters the external VPC and is routed to the active FortiGate VM via custom routes for inspection. After inspection, traffic is routed through VPC peering from the internal VPC to the service project subnet where Workload B resides.

### NEW QUESTION # 34

You have been tasked with destroying all resources relating to a recent active-active high-availability (HA) FGSP Terraform deployment in Google Cloud.

What steps do you have to take to ensure a successful deletion? (Choose two.)

- A. Use the command terraform plan before destroying the Terraform template.
- B. Delete all resources manually because active-active HA clusters cannot be destroyed using Terraform.
- C. Delete all dependencies to resources relating to the Terraform template.
- D. Use the command terraform destroy to delete all resources deployed by the Terraform template.

**Answer: C,D**

Explanation:

Removing dependencies prevents resource conflicts during deletion.

terraform destroy is the correct command to cleanly and completely remove all resources created by the Terraform deployment.
