## 최신 Google Cloud Certified Professional-Cloud-Database-Engineer 무료 샘플문제 (Q119-Q124):

### 질문 # 119

You are deploying a new Cloud SQL instance on Google Cloud using the Cloud SQL Auth proxy. You have identified snippets of application code that need to access the new Cloud SQL instance. The snippets reside and execute on an application server running on a Compute Engine machine. You want to follow Google- recommended practices to set up Identity and Access Management (IAM) as quickly and securely as possible.

What should you do?

- A. For the application server, set up a service account.
- B. For the application server, set up a common shared user account.
- C. For each application code, set up a common shared user account.
- D. For each application code, set up a dedicated user account.

정답: A

#### 질문 # 120

You are running a transactional application on Cloud SQL for PostgreSQL in Google Cloud. The database is running in a high availability configuration within one region. You have encountered issues with data and want to restore to the last known pristine version of the database. What should you do?

- A. Create a clone database from a read replica database, and restore the clone in the same region.
- B. Use the Cloud SQL database import feature. Import last week's dump file from Cloud Storage.
- C. Create a clone database from a read replica database, and restore the clone into a different zone.
- **D. Use the Cloud SQL point-in-time recovery (PITR) feature. Restore the copy from two hours ago to a new database instance.**

정답: D

#### 질문 # 121

Your retail organization is preparing for the holiday season. Use of catalog services is increasing, and your DevOps team is supporting the Cloud SQL databases that power a microservices-based application. The DevOps team has added instrumentation through Sqlcommenter. You need to identify the root cause of why certain microservice calls are failing. What should you do?

- A. Watch the Cloud SQL instance monitor for CPU utilization metrics.
- B. Watch Cloud Trace for application requests that are failing.
- C. Watch the Cloud SQL recommenders for overprovisioned instances.
- **D. Watch Query Insights for long running queries.**

정답: D

#### 질문 # 122

You are writing an application that will run on Cloud Run and require a database running in the Cloud SQL managed service. You want to secure this instance so that it only receives connections from applications running in your VPC environment in Google Cloud. What should you do?

- A. 1. Create your instance with a specified external (public) IP address.  
2. Choose the VPC and create firewall rules to allow only connections from Cloud Run into your instance.  
3. Use Cloud SQL Auth proxy to connect to the instance.
- **B. 1. Create your instance with a specified internal (private) IP address.  
2. Choose the VPC with private service connection configured.  
3. Configure the Serverless VPC Access connector in the same VPC network as your Cloud SQL instance.  
4. Connect to the instance using a connection pool to best manage connections to the instance.**
- C. 1. Create your instance with a specified internal (private) IP address.  
2. Choose the VPC with private service connection configured.  
3. Configure the Serverless VPC Access connector in the same VPC network as your Cloud SQL instance.  
4. Use Cloud SQL Auth proxy to connect to the instance.
- D. 1. Create your instance with a specified external (public) IP address.  
2. Choose the VPC and create firewall rules to allow only connections from Cloud Run into your instance.  
3. Connect to the instance using a connection pool to best manage connections to the instance.

정답: B

### 질문 # 123

You are managing a Cloud SQL for MySQL environment in Google Cloud. You have deployed a primary instance in Zone A and a read replica instance in Zone B, both in the same region. You are notified that the replica instance in Zone B was unavailable for 10 minutes. You need to ensure that the read replica instance is still working. What should you do?

- A. Verify that the new replica is created automatically.
- B. Use the Google Cloud Console or gcloud CLI to manually create a new clone database.
- C. Start the original primary instance and resume replication.
- D. Use the Google Cloud Console or gcloud CLI to manually create a new failover replica from backup.

정답: A

설명:

Recovery Process: Once Zone-B becomes available again, Cloud SQL will initiate the recovery process for the impacted read replica. The recovery process involves the following steps: 1. Synchronization: Cloud SQL will compare the data in the recovered read replica with the primary instance in Zone-A. If there is any data divergence due to the unavailability period, Cloud SQL will synchronize the read replica with the primary instance to ensure data consistency. 2. Catch-up Replication: The recovered read replica will start catching up on the changes that occurred on the primary instance during its unavailability. It will apply the necessary updates from the primary instance's binary logs (binlogs) to bring the replica up to date. 3. Resuming Read Traffic: Once the synchronization and catch-up replication processes are complete, the read replica in Zone-B will resume its normal operation. It will be able to serve read traffic and stay updated with subsequent changes from the primary instance.
