NEW QUESTION # 66

Refer to the exhibit. An administrator used the what-if tool to preview the changes to an Azure Bicep file. What will happen if the administrator applies these changes in Azure?

what-if tool

Resource and property changes are indicated with these symbols:

- Delete
- + Create
- ~ Modify

The deployment will update the following scope:

```
Scope: /subscriptions/./resourceGroups/ExampleGroup
~ Microsoft.Network/virtualNetworks/vnet-002 [2018-10-01]
  - tags.Owner: "Production"
  ~ properties.subnets: [
    + 0:
      name:                 "subnet001"
      properties.addressPrefix: "10.0.0.0/25"
  ]
```

Resource changes: 1 to modify.

- A. The VNet address space will be updated.
- B. The vnet-002 VNet will be renamed Production.
- C. The resulting VNet will have a single subnet.
- D. A new subnet will be added to vnet-002.

Answer: D

Explanation:

The what-if output shows a modification (~) to the VNet vnet-002 where a new subnet (+ subnet001 with address prefix 10.0.0.0/25) will be created. Applying the changes will therefore add a new subnet to the existing VNet.

A senior administrator in a multinational organization needs to include a comment in the template shown in the exhibit to ensure that administrators from other regions change the Amazon Machine Image (AMI) ID to one that is valid in their location.

How can the administrator add the required comment in that section of the file?

- A. The administrator can add the comment starting with the # character next to the "Resources" section.
- **B. The administrator must convert the template file to YAML format to add a comment.**
- C. The administrator must update the AWSTemplateFormatVersion to the latest version.
- D. The administrator can include the comment with the aws cloudformation update-stack command.

Answer: B

Explanation:

According to the FortiOS 7.6 AWS Administration Guide and the Fortinet 7.4 Public Cloud Security study materials regarding infrastructure as code (IaC) for cloud deployments:

* JSON Format Limitations (Option B): The exhibit shows an AWS CloudFormation template in JSON (JavaScript Object Notation) format. JSON, by its official specification, does not support comments. There is no native syntax (like // or /* */) to include remarks that are ignored by the CloudFormation parser.

* YAML Support: To add descriptive comments-such as instructing other regional administrators to update the AMI ID-the administrator must convert the template into YAML format. YAML is a superset of JSON and specifically supports comments using the # character.

* Best Practice for Multinational Deployments: For organizations operating across multiple AWS regions, using YAML is the recommended standard because it allows for inline documentation, making templates more maintainable and easier for different teams to understand regional requirements.

Why other options are incorrect:

* Option A: Comments are part of the template file itself, not a parameter or flag within the aws cloudformation update-stack CLI command.

* Option C: While # is the correct character for comments in YAML, it is invalid syntax in JSON and would cause the CloudFormation stack creation to fail with a parsing error.

* Option D: The AWSTemplateFormatVersion "2010-09-09" is currently the only valid version for CloudFormation templates; updating it does not add JSON comment support.
