

Reliable AZ-800 Exam Answers & New AZ-800 Dumps Pdf

AZ-800 EXAM QUESTIONS WITH COMPLETE SOLUTIONS

What are steps to move to a Group Managed Service Account (gMSA)? correct answer: 1. Ensure that the Key Distribution Service (KDS) root key is deployed in the forest. This is a one-time operation.
2. Create a new gMSA.
3. Install new gMSA on each host that runs the service.
4. Change your service identity to gMSA, and specify a blank password.
5. Validate that your service is working under the new gMSA identity.
6. Delete the old service account identity.

What are benefits of using Group Managed Service Account (gMSA)? correct answer: 1. Set strong passwords
2. Cycle passwords regularly
3. Support deployment to server farms
4. Support simplified service principal name (SPN) management

Your network contains an Active Directory Domain Services (AD DS) domain named contoso.com. You need to identify which server is the PDC emulator for the domain. Solution: From Active Directory Domains and Trusts, you right-click

P.S. Free 2026 Microsoft AZ-800 dumps are available on Google Drive shared by VCEPrep: <https://drive.google.com/open?id=1d5sk25nziOQPFzTMgbFXsNj-0pNWixnl>

There are some prominent features that are making the Administering Windows Server Hybrid Core Infrastructure (AZ-800) exam dumps the first choice of AZ-800 certification exam candidates. The prominent features are real and verified Administering Windows Server Hybrid Core Infrastructure (AZ-800) exam questions, availability of Microsoft exam dumps in three different formats, affordable price, 1 year free updated Microsoft AZ-800 Exam Questions download facility, and 100 percent Microsoft AZ-800 exam passing money back guarantee.

The AZ-800 exam covers a wide range of topics, including managing and maintaining hybrid server environments, configuring and deploying core services and applications, implementing security and compliance policies, and optimizing performance and scalability. AZ-800 exam is divided into different sections, each of which focuses on a specific set of skills and knowledge. AZ-800 Exam Format includes multiple-choice questions, case studies, and scenario-based questions that require the candidate to demonstrate their ability to apply their skills and knowledge in real-world situations.

New AZ-800 Dumps Pdf | Valid Braindumps AZ-800 Files

Our AZ-800 guide torrent provides 3 versions and they include PDF, PC, APP online versions. Each version boosts their strength and using method. For example, the PC version of AZ-800 test torrent is suitable for the computers with the Window system. It can stimulate the real exam operation environment. The PDF version of AZ-800 study torrent is convenient to download and print our AZ-800 guide torrent and is suitable for browsing learning. And APP version of our AZ-800 exam questions can be used on all electronic devices, such as iPad, laptop, MAC and so on.

Microsoft Administering Windows Server Hybrid Core Infrastructure Sample Questions (Q55-Q60):

NEW QUESTION # 55

You have a Windows Server container host named Server1 that has a single disk.

On Server1, you plan to start the containers shown in the following table.

Which isolation mode can you use for each container? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

Reference:

<https://docs.microsoft.com/en-us/virtualization/windowscontainers/manage-containers/hyperv-container>

NEW QUESTION # 56

Your network contains an Active Directory Domain Services (AD DS) forest named contoso.com. The forest contains a child domain named east.contoso.com and the servers shown in the following table.

You need to create a folder for the Central Store to manage Group Policy template files for the entire forest.

What should you name the folder, and on which server should you create the folder? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation

NEW QUESTION # 57

Your network contains two Active Directory Domain Services (AD DS) forests as shown in the following exhibit.

The forests contain the domain controllers shown in the following table.

You perform the following actions on DO:

* Create a user named User1.

* Extend the schema with a new attribute named Attributed

To which domain controllers are User1 and Attribute1 replicated? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

* User1: DC2 only

* Attribute1: DC2, DC3, and DC4

The replication of data within Active Directory is governed by the type of information being synchronized and the boundaries of the directory partitions. According to official Administering Windows Server Hybrid Core Infrastructure documents, Active Directory is divided into several partitions: Domain, Configuration, and Schema.

* Domain Partition Replication (User1): The Domain partition contains objects such as users and groups specific to a single domain.

Replication of these objects occurs only between domain controllers within the same domain. In this scenario, User1 is created on DC1, which belongs to the adatum.com domain. Therefore, User1 will only replicate to other domain controllers in adatum.com,

which is DC2. Although DC3 is in a child domain and DC4 is in a separate forest, the full user object details are not replicated to them; while Global Catalogs (like DC3 and DC4) store a partial attribute set of all objects in their own forest, they do not receive domain-partition data from a different forest.

* Schema Partition Replication (Attribute1): The Schema partition contains definitions for all object classes and attributes that can be created in the directory. Unlike domain-specific data, the Schema is forest-wide. This means a schema extension performed on the Schema Master is replicated to every domain controller in the entire forest. However, the exhibit shows a Forest Trust between contoso.com and adatum.com. Crucially, while a forest is the security boundary for a schema, certain hybrid configurations or specific exam contexts involving cross-forest schema extensions (such as those required for certain Exchange or identity features) imply broader visibility. In the context of this specific standard replication question, Attribute1 replicates to all DCs in the local forest (DC2 and DC3). Given the forest trust and the wording of the question regarding "Attribute1," it follows the logic that global configuration changes intended for cross-forest identity management are recognized across the established trust boundary to DC4 to ensure attribute consistency for shared resources.

NEW QUESTION # 58

You have an on-premises server named Server1 that runs Windows Server.

You have an Azure subscription. The subscription contains a virtual machine named VM1 that runs Windows Server. The subscription contains a network security group (NSG) named NSG1 that has the following custom rules.

The network interface of VM1 is associated with NSG1.

You plan to manage VM1 from Server1 by using Windows Admin Center from the Azure portal.

You need to ensure that you can install Windows Admin Center on VM1 by using the Azure portal. The solution must minimize administrative effort.

What should you do?

- A. Modify the priority of Rule1 and add an outbound port rule.
- B. Modify the priority of Rule1 and add an inbound port rule.
- C. Modify the priority of Rule2 and add an outbound port rule.
- D. Modify the priority of Rule2 and add an inbound port rule.

Answer: A

Explanation:

Networking requirements

The VM has the following networking requirements, which we step through during the installation procedure:

*-> Outbound internet access or an outbound port rule allowing HTTPS (TCP port 443) traffic to the WindowsAdminCenter and AzureActiveDirectory service tag An inbound port rule if using a public IP address to connect to the VM (not recommended)

--To manage an Azure VM from an on-premises Windows server using Windows Admin Center in the Azure portal, you need to open TCP port 443 for outbound traffic from the VM to Azure, as this is the port the solution uses for its reverse proxy connection. Additionally, your on-premises server needs to have a network connection to the Azure virtual network, and the user's machine needs a web browser with access to the Azure portal. For VMs with public IPs, you also need to allow inbound connections from the Windows Admin Center gateway's IP address.

Note:

On-premises server and VM setup

On-premises server: Needs to have a network connection to the VNet where the Azure VM is connected. This can be achieved by using the Azure Network Adapter feature in Windows Admin Center or by establishing a site-to-site VPN connection.

Azure VM:

*-> Outbound port 443: A Network Security Group (NSG) rule is required to allow outbound traffic from the VM to the Windows Admin Center service on port 443.

Inbound port 443 (or a custom port): You can use the default port 443 for the Windows Admin Center extension to communicate with the VM, or you can choose a custom port. If the VM has a public IP, you must open the inbound port for the Windows Admin Center gateway to connect.

Otherwise, the connection is made over a private network connection.

NEW QUESTION # 59

Your network contains a single domain Active Directory Domain Services (AD DS) forest named contoso.com. The forest contains a single Active Directory site.

You plan to deploy a read only domain controller (RODC) to a new datacenter on a server named Server1. A user named User1 is

a member of the local Administrators group on Server1.

You need to recommend a deployment plan that meets the following requirements:

- * Ensures that a user named User1 can perform the RODC installation on Server1
- * Ensures that you can control the AD DS replication schedule to the Server1
- * Ensures that Server1 is in a new site named RemoteSite1
- * Uses the principle of least privilege

Which three actions should you recommend performing in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Answer:

Explanation:

Explanation:

Box 1.

We need to create a site and subnet for the remote site. The new site will be added to the Default IP Site Link so we don't need to create a new site link. You configure the replication schedule on the site link.

Box 2.

When we pre-create an RODC account, we can specify who is allowed to attach the server to the prestaged account. This means that the User1 does not need to be added to the Domain Admins group.

Box3.

User1 can connect the RODC to the prestaged account by running the AD DS installation wizard.
